ESTIMATES OF THE POPULATION OF THE UNITED STATES, BY AGE, SEX, AND RACE: APRIL 1, 1960 TO JULY 1, 1973

(Advance data for April 1, 1970 to July 1, 1973 appeared in *Current Population Reports*, Series P-25, No. 511. The figures in this report supersede those presented in P-25, Nos. 490, 483, 441, 385, 367, and 321)

INTRODUCTION

This report presents estimates of the population of the United States by single years of age, sex, and race for July 1, 1960 to 1973 and for April 1, 1960 and 1970, the dates of the two most recent censuses of population. Estimates are shown for the total population including Armed Forces overseas, the resident population, and the civilian population.¹

The estimates in this report were prepared using a variant of the cohort-component method which takes account of estimated net census undercount by age, sex, and race. This procedure is referred to in this report as the "inflation-deflation" method. The inflation-deflation method has been used previously in the preparation of

¹The estimates for each July 1 are subject to revision on the basis of additional data on the components of population change (births, deaths, and net immigration). Final estimates for the 1960-1970 intercensal period, which will reflect final 1970 vital statistics and further research on net immigration, will differ only slightly from the figures presented here.

intercensal age estimates, but not in the preparation of postcensal estimates. For a detailed discussion of the inflation-deflation method, see the section on "Sources and Methods".

TRENDS IN POPULATION STRUCTURE: 1960-1973

Changes in Age Structure. In the 1960-1970 intercensal period, the total population of the United States including Armed Forces overseas increased from 180.0 million to 204.3 million, or by 13.5 percent. On July 1, 1973, the population was 210.4 million, or 3.0 percent above the April 1, 1970 figure (table A). During the 1960-1973 period, the average annual percent increase was 1.2 percent; however, the rate of increase declined, with some interruption in the 1968-1971 period, from 1.7 percent in the 1960-1961 fiscal year to 0.7 percent in the 1972-1973 fiscal year (table B).

Due largely to fluctuations in annual births during most of the twentieth century and to a lesser degree to changing patterns of mortality and net immigration, the trends in population in most age groups have differed greatly from

Table A. Age Structure of the Population: July 1, 1973, April 1, 1970, and April 1, 1960

(Numbers in thousands. Total population including Armed Forces overseas)

trends in total population (figure 1).² The most significant of these fluctuations in births has been the post-World War II "baby boom." Its effect on the age structure of the United States population in the 1960-1973 period can be illustrated with population pyramids (figure 2). Superimposing the 1973 pyramid on the 1960 pyramid highlights the decline of the population in the young childhood ages, the movement of the

large cohorts of the post-World War II "baby boom" into the young adult ages, and the movement of the small cohorts born in the 1930's into the middle adult ages.

The median age of the population declined during most of the 1960's as the annual number of births was relatively high and the small birth cohorts of the 1930's were passing through the 25 to 29 age group in which the median age falls. However, the decline in births after the 1970-1971 fiscal year and the entry of the large post-World War II "baby-boom" cohorts into the 25 to 29 age group has led to a reversal in the trend of the median age of the population (table C). The figure dropped from an historical peak of 30.3 in 1952 to 27.9 in 1971 (the lowest figure since the mid 1930's) and then increased to 28.4 in 1973.

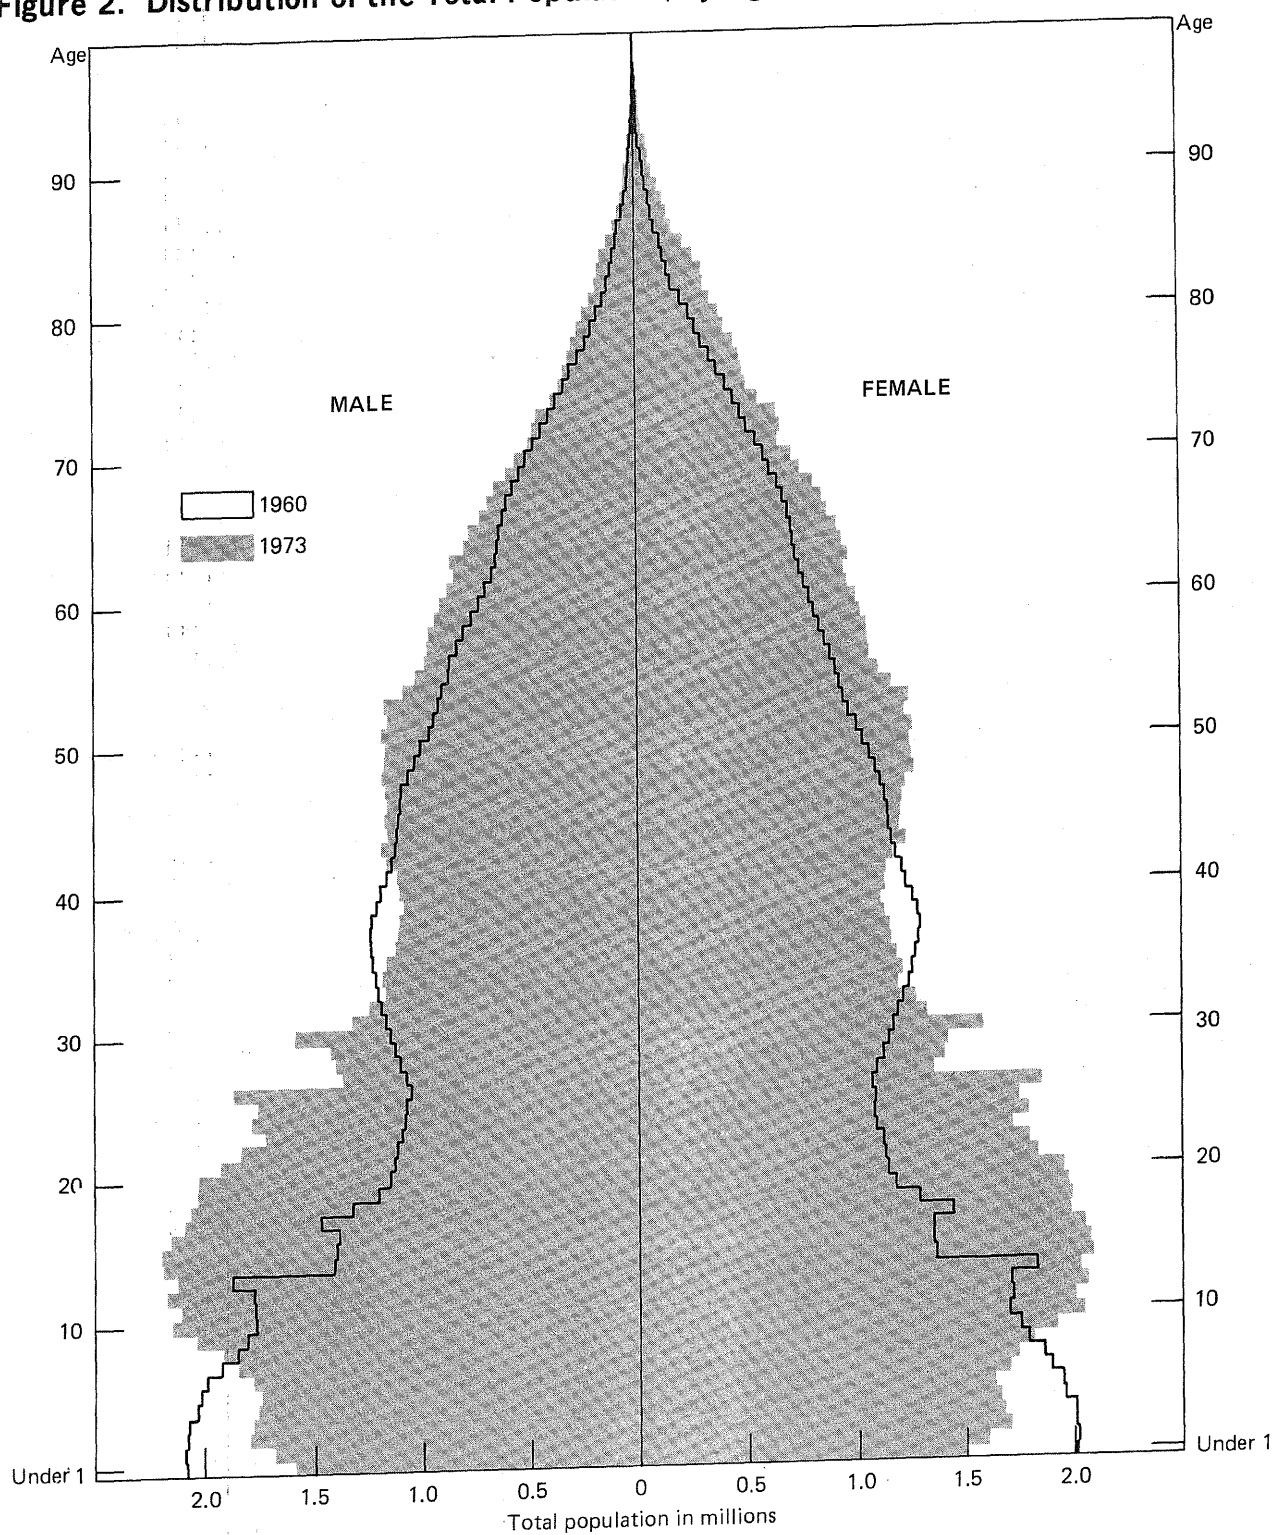

Age Structure by Race. The white and Negro populations both experienced the major changes in age structure in the 1960-1970 and 1970-1973 periods noted earlier for the total population. However, due to higher fertility rates in the

²Omitting short-term fluctuations, the trend in annual births during the twentieth century has been as follows: an increase from about 2.5 million in 1900 to 3.1 million in 1921, a decrease to 2.3 million in 1933, an increase to 4.3 million in the 1957-1961 period, and a decrease to 3.1 million in 1973. Ansley J. Coale and Melvin Zelnik, New Estimates of Fertility and Population in the United States (Princeton, New Jersey: Princeton University Press), 1963. Ansley J. Coale and Norfleet W. Rives, Jr., "A Statistical Reconstruction of the Black Population of the United States 1880-1970," Population Index, Vol. 39, No. 1 (January, 1973), pp. 3-36. National Center for Health Statistics, Vital Statistics of the United States: 1968 and Monthly Vital Statistics Report.

Figure 2. Distribution of the Total Population, by Age and Sex: July 1, 1960 and 1973

Source: Table 1 and Table 4.

Negro population than in the white population,³ growth rates in total population and in the various age groups have typically been higher for the Negro population. In the two age groups in which the Negro population declined (under 5 from 1960 to 1970 and 5 to 13 from 1970 to 1973), the declines in the white population were greater (table D).

The comparatively high fertility rates of the Negro population are largely responsible for its young age structure (figure 3). In 1973, the median age of the Negro population was 22.9 as compared with 29.2 for the white population (table C).

³National Center for Health Statistics, *Vital Statistics of the United States 1968*, table 2. Annual components of population change by race for the 1960-1973 period are shown in table 9 of this report.

¹Males per 100 females.

Sex Ratio by Age. In 1973, the sex ratio (males per 100 females) of the total population was 95.5, down from 95.9 in 1970 and 97.8 in 1960 (table E). The sex ratio generally decreases with age due to the fact that age-specific mortality rates are higher for males than for females.⁴ For young ages through the 18 to 24 group, the sex ratio is above 100, reflecting the greater number of male births than female births.

The most pronounced change in the sex ratio occurred in the age group 65 years and over--from 82.9 in 1960 to 72.1 in 1970 and 70.3 in 1973. This decline is due primarily to the greater reductions among females than among males in mortality rates in the older ages since 1960. A secondary factor is the declining proportion foreign born in the population 65 years and over. Survivors of the large number of pre-Depression immigrants (who were mostly male) are concentrated in this age group.⁵

COVERAGE OF POPULATION

Estimates of the population of the United States by single years of age, sex, and race, are shown for April 1, 1960 to July 1, 1973 for the total population including Armed Forces overseas, the resident population, and the civilian population. Estimates of the total population and the resident population adjusted for estimated net census undercount are shown for April 1, 1960 and 1970. Table 9 presents estimates of the components of population change by race for fiscal years from 1960 to 1973.

The resident population conforms to the concept of the United States population as shown in the census reports. It includes residents of the 50 States and the District of Columbia, but excludes residents of the Commonwealth of Puerto Rico, residents of the outlying areas under United States sovereignty or jurisdiction (principally American Samoa, Canal Zone, Guam, Virgin Islands of the United States, and the Trust Territory of the Pacific Islands), and other American citizens living overseas. The total population including Armed Forces overseas includes the resident population and the Armed Forces stationed in foreign countries, Puerto

Rico, and the outlying areas, but not their dependents. The civilian population represents the resident population less the Armed Forces stationed in the United States.

SOURCES AND METHODS

General Sources and Methods. The population estimates presented in this report are based on the 1960 and 1970 census counts, on evaluation of the census counts by demographic analysis, and on estimates of the components of population change for April 1, 1960 to July 1, 1973. Estimates of births and deaths were provided by the National Center for Health Statistics, U.S. Public Health Service. Data on members of the Armed Forces were obtained from the Department of Defense and from each branch of the military service. Estimates of net civilian immigration were derived from (1) statistics on the number of immigrants admitted for permanent residence provided by the Immigration and Naturalization Service, Department of Justice, (2) data on the number of civilian federal employees overseas, their dependents, and dependents of the Armed Forces overseas provided by the Civil Service Commission and the Department of Defense, (3) data on passenger travel between the United States and Puerto Rico provided by the Government of Puerto Rico, and (4) data available on the permanent movement of citizens and aliens to foreign countries.

Inflation-Deflation Method. The estimates in this report were prepared using the "inflation-deflation" method which is a variant of the cohort-component method that takes account of estimated net census undercount by age, sex, and race. The inflation-deflation method is preferable to the cohort-component method as used previously in preparing postcensal estimates because the inflation-deflation method preserves the actual pattern of population change by age rather than by cohort. The vast majority of users of age estimates are interested in change over time in the population in specific ages or age groups and not in change over time in cohorts.

In the inflation-deflation method, the April 1 census population base including Armed Forces overseas is "inflated" to adjust for estimated net census undercount by age, sex, and race, and the resulting population estimates are carried forward by age to July 1 of each subsequent year by adding births, subtracting deaths, and adding net migration. The July 1 estimates are then "deflated" to reflect estimated percent net census undercount by age, sex, and race. Finally, an extremely small pro rata adjustment is made to the deflated estimates in each

⁴National Center for Health Statistics, *Monthly Vital Statistics Report, "Annual Summary for the United States, 1972,"* Vol. 21, No. 13 (June 27, 1973), table 5.

⁵Bureau of the Census, *Historical Statistics of the United States: Colonial Times to 1957*, p.62, and *Census of Population: 1970, Final Report PC(2)-1A, National Origin and Language*, p.440.

sex-race group to bring them into exact agreement with an independent estimate of the population in each sex-race group obtained by carrying forward the census population with information on subsequent births, deaths, and net immigration without regard to age.

The inflation-deflation procedure yields estimates that preserve the pattern of actual population change by age. This can be illustrated with an extreme example using the April 1, 1970 total population including Armed Forces overseas. The Negro male populations in the 15 to 19 and 20 to 24 age groups are 1,213,000 and 907,000, respectively (table 5). The corresponding figures adjusted for estimated net census undercount are 1,267,000 and 1,023,000 (table A-1). Thus the estimated net undercount is 54,000, or 4.3 percent, in the 15 to 19 group and 116,000, or 11.3 percent, in the 20 to 24 group. For illustrative purposes, the small numbers of deaths and net immigrants in these age groups can be assumed to be offsetting in the short term, and thus the actual population moving from the 15 to 19 age group in 1970 to the 20 to 24 age group in 1975 would remain constant.

In the method used previously (i.e., applying the cohort-component method to census level figures), the Negro male population 20 to 24 years old in 1975 would have been 1,213,000 or 33.7 percent higher than the 1970 figure of 907,000. However, the estimates adjusted for net census undercount would yield a much different picture: an increase from 1,023,000 to 1,267,000 or 23.9 percent. The inflation-deflation procedure would deflate the 1975 figure of 1,267,000 by 11.3 percent (the estimated net undercount in the 20 to 24 age group in 1970) and would yield a deflated estimate of 1,124,000, which is 23.9 percent above the 1970 census level figure of 907,000, and which is the actual percent increase.

As in this example, the application of the cohort-component method alone to census level figures results in considerable distortion when adjacent age groups (e.g., 15 to 19 and 20 to 24) have estimated percent undercounts that differ greatly. If estimated percent net census undercounts were uniform by age, the two methods would yield identical results.

The actual pattern of population change by age and by cohort would be preserved if estimates were prepared for the population adjusted for estimated net census undercount rather than for the census level population; however, there are several drawbacks to the use of population

estimates adjusted for net census undercount: (1) they are subject to error (i.e., the undercount itself is estimated) and to revision on the basis of additional information; (2) use of population estimates adjusted for estimated net census undercount in conjunction with information on various social and economic characteristics requires an assumption about the characteristics of the unenumerated population, about which there is little reliable information; (3) the production of a consistent set of subnational estimates (e.g., for States and counties) is not now feasible because there is no reliable method for distributing net undercount by age, sex, and race to subnational areas; (4) they are not comparable with existing time series.

Census Population Base, April 1, 1960. The April 1, 1960 population figures shown in tables 5 through 8 are based on complete-count population data from the 1960 census tabulated by age, sex, and color. This age detail is available for 5-year age groups for ages under 85 years and for single years of age for ages under 21 years.

To facilitate the computations, the population for ages 21 to 84 was also distributed by single years. The population 21 to 24 years of age, including Armed Forces overseas, was distributed in proportion to annual births from 1935 to 1939. Since births were much less completely registered in the years before 1935, and since immigration contributed substantially to population growth in the pre-Depression years, birth statistics were not used for distributing grouped data by single years of age for the older population. Instead, the population in 5-year age groups by color and sex, including Armed Forces overseas, was distributed by osculatory interpolation. This mathematical form of interpolation provided a series of figures for single years of age which is consistent with the 5-year age totals, and shows a smooth transition from one age to the next.

In order to provide a smooth transition between the figures for single years of age based on births for ages 21 to 24 and those obtained by mathematical interpolation for ages 30 and over, the figures for single years of age for the 25 to 29 year age group were derived by averaging the results of the two methods. The procedure involved splicing the two series over the five ages by applying shifting pairs of complementary weights to the original pairs of estimates with each series of weights forming a linear progression.

Data for the Negro population by single years of age and sex are not available from the 1960 census, and data by 5-year age groups are

available only from the 25-percent sample. Therefore, the 25-percent sample data for Negroes were adjusted to be consistent with complete-count data for Negro and other races by 5-year age groups. Conversion of the 5-year data to single years of age for the population 30 years and over for Negroes and for Negro and other races was done by osculatory interpolation as described above.

For ages under 30, the percent Negro of the total Negro and other races population was estimated for single ages by straight-line interpolation of the percents in 5-year age groups. The Negro population was obtained by applying these percents to Negro and other races by single years of age.

Census Population Base, April 1, 1970. The figures for April 1, 1970 shown in tables 5 through 8 are based on complete-count population data by single years of age from the 1970 census. However, because of an overstatement of the other races population (other than white or Negro) and of centenarians in the complete-count census data, adjustments were made in the published census figures by age, sex, and race.⁶

In the complete count tabulations, the white population was slightly understated and the other races population was overstated. Most of this misclassification by race occurred because some persons of Spanish ancestry reported themselves as of "other" unspecified race rather than white (as expected) or other specified race. As a result of editing the question on race in the sample tabulations, approximately 327,000 persons, or about 63 percent of the population of unspecified races, were transferred from other races to white. A second adjustment of the complete-count data was necessary because the population over 100 years of age was overstated by an estimated 103,000. The amount of error was estimated for each sex-race group, and since the errors were believed to be spread over the entire age range, the amount was distributed pro rata to the ages under 100.

Finally, an upward adjustment of approximately 23,000 was necessary so that the total population by age, sex, and race would add to the official population count of 203,235,298. The addition represents the sum of the corrections which were made in the population counts after the

initial detailed tabulations were made. The addition was made by age, sex, and race according to the estimated characteristics of the persons added.

Adjustment for Net Census Undercount. In order to use the inflation-deflation method of making detailed population estimates for each July 1, it was necessary first to derive estimates of the April 1, 1960 and April 1, 1970 population adjusted for estimated net census undercount. The adjusted estimates of the resident population by sex, race, and 5-year age groups for 1960 and 1970 were derived by adding estimates of net census undercount to the census population bases described above.⁷ Estimates of the Armed Forces stationed outside the United States on the census dates were added to the adjusted resident population figures since most of the calculations done for this report involve estimates of the total population including Armed Forces overseas.

The final step in deriving estimates of the total population adjusted for net census undercount on April 1, 1960 and 1970 was to distribute the adjusted population estimates in 5-year age groups into single years of age. The estimated figures for the population under 35 years of age in 1970 were distributed from 5-year age groups into single years of age in proportion to annual births from 1935 to 1970. Estimates of the adjusted population 35 years and over by single years of age in 1970 were derived by distributing the estimates of net census undercount for 5-year age groups to single years of age and adding the estimates to the 1970 census base. The estimates of undercount by single years of age, sex, and race for the population 35 and over in 1970 were computed as follows: (1) estimates of percent undercount for single years of age were derived by osculatory interpolation of the estimated percent undercount in 5-year age groups; (2) preliminary estimates of the amount of undercount for single years were computed using the census base and the interpolated percent undercounts; (3) the estimates of undercount by single years were adjusted pro rata to agree with the estimates for 5-year age groups.

Essentially the same procedure was used in 1960 as in 1970 to distribute the adjusted population to single years of age. The only exception was that annual births were used to distribute

⁶Bureau of the Census, Census of Population: 1970, Final Report PC(1)-B1, General Population Characteristics, p. App-8, and Final Report PC(1)-C1, General Social and Economic Characteristics, p. App-6.

⁷Bureau of the Census, Census of Population and Housing: 1970, Evaluation and Research Program PHC(E)-4, Estimates of Coverage of Population by Sex, Race, and Age: Demographic Analysis, February 1974.

the 5-year age groups under 25 in 1960 and the population over 25 in 1960 was distributed to single years of age by the interpolation procedure. The distribution of the 5-year age groups to single years of age in 1960 and 1970 was done separately for each sex and race group.

Population Estimates for July 1, 1960 to 1969. The estimates of the total population including Armed Forces overseas by age, sex, and race for July 1, 1960 to July 1, 1969 shown in table 1 were computed by carrying forward the April 1, 1960 population adjusted for net census undercount to each subsequent July 1 and then deflating the adjusted estimates to be consistent with the 1960 and 1970 census bases. This produced a smooth transition in the pattern of undercount from 1960 to 1970 and eliminated the error of closure.⁸

The deflation of the adjusted estimates to census level was done by computing "deflation factors" by sex, race, and single years of age for April 1, 1960 and for April 1, 1970. A deflation factor is defined as the ratio of the census level estimate to the population adjusted for net census undercount. The April 1, 1960 and 1970 deflation factors for each age were interpolated linearly to each July 1 and multiplied by the population estimates adjusted for net census undercount to produce census-consistent estimates. The final step in the estimating procedure consisted of a small pro rata adjustment by sex and race to assure that the sum of the age detail agreed with the independent population totals. These totals are based on census counts and estimates of subsequent births, deaths, and net immigration.

Estimates of the resident population for July 1, 1960 to 1969, shown in table 2, were derived by subtracting the estimated number of Armed Forces stationed overseas from the total population including Armed Forces overseas. Estimates of the civilian population for the same period, shown in table 3, were derived by subtracting the estimated number of military personnel stationed inside the United States from the estimates of the resident population.

Population Estimates for July 1, 1970 to 1973. The procedure for estimating the total

population including Armed Forces overseas for July 1, 1970 to July 1, 1973 was similar to the procedure used for the 1960 to 1969 estimates. The only difference was that the April 1, 1970 deflation factors were used for each July 1 without change. The April 1, 1970 population adjusted for net census undercount by age, sex, and race was carried forward to each July 1, deflated to census level by the April 1, 1970 deflation factors, and adjusted proportionately to agree with the independent population totals by sex and race. The detailed estimates of the resident and civilian populations for July 1, 1970 to 1973 were derived by subtracting the appropriate Armed Forces figures from the total population including Armed Forces overseas.

Estimates of Births and Deaths. The estimates of births and deaths used in this report are based on tabulations of vital statistics for the resident population made by the National Center for Health Statistics, U.S. Public Health Service. Final tabulations were used for registered births and deaths for 1960 to 1969. Estimates of total births and deaths for 1970 to 1973 are based on provisional figures. The estimates of births for 1970 to 1973 were distributed by race using data from States that have statistics available on the number of births by race during the period. Provisional estimates of resident deaths by age, sex, and race for 1970 to 1973 are based on a 10-percent sample of death certificates from the National Center for Health Statistics.

The estimates of births by sex and race for April 1, 1960 to 1970 have been adjusted for underregistration by factors obtained by extrapolating the results of the 1950 Birth Registration Test. A sample birth registration test for the 1964-1968 period was conducted by the Bureau of the Census in 1970.⁹ However, the results of the 1970 test have not been used in this report so that the population totals for July 1, 1960 to 1969 would be consistent with published monthly population totals for the intercensal period. Final population estimates by age, sex, and race for the intercensal period will be consistent with the results of the 1970 test. The correction for underregistration was dropped after April 1, 1970 because it is estimated that the registration of total births is now 99 percent complete.

⁸The error of closure is defined as the population change shown by two census counts minus the population change for the same period as derived from data on the components of population change.

⁹Bureau of the Census, Census of Population and Housing: 1970, Evaluation and Research Program PHC(E)-2, Test of Birth Registration Completeness 1964 to 1968, March 1973.

Data provided by the Department of Defense and the National Center for Health Statistics of the Public Health Service have been used to estimate deaths of military personnel.

Net civilian immigration. Estimates of net civilian immigration to the United States for the 1960 to 1973 period were derived by combining estimates for four separate categories: (1) alien immigration, (2) net arrivals of civilian citizens, (3) net arrivals from Puerto Rico, and (4) emigration from the United States. Because complete data by age, sex, and race are not available for any of the categories of net civilian immigration, a variety of methods were used to estimate these characteristics.

1. Alien immigration. The annual report of the Immigration and Naturalization Service provides figures by age and sex for aliens admitted for permanent residence in the United States. The collection of data on the race of alien immigrants was discontinued in 1961.

Estimates of the race of alien immigrants for this report for July 1961 to March 1970 are based on the reported country of birth of alien immigrants and on the race of the foreign-born population by country of birth as enumerated in the 1960 census. Information on the race, sex, and country of origin of the foreign-born population who entered the United States in the 1960-1964 and 1965-1970 periods is available from special tabulations of 1970 census data. The census figures for the 1965-1970 period have been used to estimate the race of alien immigrants for April 1970 to June 1973. Revised estimates by race will be used in preparing final intercensal estimates by age, race, and sex.

Aliens who entered the United States on a conditional basis and later adjusted to permanent residence status were added to the population estimates in the year of entry instead of the year that they appeared in official immigration statistics. For example, many Cuban refugees who entered the United States between 1960 and 1966 were officially admitted for permanent residence in 1968, and those who entered after 1966 were admitted for permanent residence two years or more after arrival.

Because of the lack of reliable information, aliens entering the United States illegally are not included in estimates of alien immigration.

2. Net arrivals of civilian citizens. The category of net arrivals of civilian citizens is estimated on the basis of the change in the number of civilian federal employees overseas, their dependents, and dependents of the Armed Forces overseas, as reported by the Department of Defense and Civil Service Commission. A change in the size of the overseas population, minus its natural increase, is assumed to indicate net movement to or from the United States. The net movement of civilian citizens overseas not affiliated with the Federal Government is not taken into account.

April 1, 1960 census data were used to distribute the number of civilian federal employees and their dependents overseas by age, sex, and race. Data from the 1970 census will be used also in the preparation of final intercensal estimates. The estimates of Armed Forces dependents overseas were distributed by race according to the estimates by race of the Armed Forces overseas.

3. Net arrivals from Puerto Rico. Estimates of the net movement of persons between Puerto Rico and the United States mainland were based on the movement of passengers as reported by the Puerto Rico Planning Board. The age and sex distribution of these travelers was based on a sample survey taken by the Puerto Rico Bureau of Labor statistics and released by the Division of Demographic Registry and Vital Statistics of the Puerto Rico Department of Health. All persons migrating between the United States and Puerto Rico were assumed to be white. Data through June 1973 were used in preparing the estimates given here. Data from the 1970 census on movement between the United States and Puerto Rico will be used in the preparation of final intercensal estimates.

4. Emigration from the United States. No direct information about emigration of aliens or citizens is available for the period covered by this report. The Immigration and Naturalization Service stopped collecting data on alien emigration in 1957, and permanent departures of citizens are not recorded. Estimates of annual emigration for the 1960 to 1970 period were made using data on permanent arrivals from the United States published by various foreign countries and data provided by the Social Security Administration showing the migration of beneficiaries between the United States and foreign countries. The estimates of emigration in this section are independent of categories 2 and 3 discussed previously.

The majority of the estimated 250,000 emigrants during the 1960's were United States citizens admitted for permanent residence in Canada.¹⁰ Therefore the age and sex distribution for all emigrants was based on statistics published annually by Canada showing the number of immigrants who last resided in the United States. The estimates of total emigration are understated because statistics on permanent arrivals from the United States are not available for many countries and because little information is available on alien emigration. Methods are being developed to make estimates of emigration using 1960 and 1970 census data on the foreign-born population and 1970 census data on year of immigration.

Armed Forces. To derive estimates of the resident population and the civilian population, estimates were made of the total Armed Forces and of the Armed Forces overseas. The estimates are based on data from the Department of Defense and from the Army, Navy, Air Force, Marine Corps, and the Coast Guard.¹¹ Reserve forces on a 6-month tour of training and students at the military academies are included in estimates of the Armed Forces; reserve forces on short tours of training, national guardsmen, and officers in the Public Health Services are not included.

¹⁰Richard Irwin and Robert Warren, "Demographic Aspects of American Immigration," U.S. Commission on Population Growth and the American Future, Vol. I of the Commission research reports, Demographic and Social Aspects of Population Growth (Washington, D. C.: Government Printing Office, 1972), pp. 167-178.

¹¹Although figures on the size and distribution of the Armed Forces for April 1960 and 1970 are available from the census, statistics obtained from the military services are used as the source for the estimates here because they provide a consistent series over time.

Prior to 1970 the estimates of the Armed Forces were distributed by age, sex, and race using sample survey data gathered periodically by each branch of the service. Since 1970 the Army, Navy, Air Force, Marine Corps, and Coast Guard have provided statistics by age, sex, and race from basic personnel records.

Rounding. Each figure in this report has been rounded independently to the nearest thousand from figures computed to the last digit; hence, the sum of parts may differ from the totals shown. Derived measures are based on the unrounded figures. Median ages are based on data for 5-year age groups.

¹Represents zero or rounds to zero.

²Percent of population at beginning of period.

³Adjusted for underregistration through March 1970.

⁴Deaths occurring in the United States plus estimated deaths occurring to Armed Forces overseas.

⁵Comprises estimates of overseas admissions into and discharges from the Armed Forces and the "error of closure" between censuses.

APPENDIX
