Marital Status and Living Arrangements: March 1977

INTRODUCTION

This report presents data on the marital status of persons 14 years old and over, family relationships, presence of parents for persons under 18 years old, and household living arrangements of the noninstitutional population of the United States. In comparing data from the 1977 survey with data from earlier surveys, it was found that:

- More adults are remaining single or postponing first marriage.
- The number of households composed entirely of unrelated persons is increasing.
- The estimated level of divorce is rising.

- A greater number of families are being maintained by persons without a spouse.
- The youthful population is decreasing but the number of children living with only one parent is increasing.

These and other trends discussed in this report reflect the changing behavior of adults regarding marriage, divorce, and living arrangements and have important bearing on the direction and content of current and future social and economic programs.

AGE AT FIRST MARRIAGE

The postponement of marriage among young adults is one of the most notable trends regarding marriage and family

¹Differences shown were derived by using rounded percentages.

Source of 1960 data: 1960 Census of Population, Volume I, "Detailed Characteristics," U.S. Summary, table 176.

living in recent years. The proportion of all women 20 to 24 years old who had never married increased by more than one-half between 1960 and 1977 from 28 percent to 45 percent (table A). Among men 20 to 24 years old, the proportion never married increased from 53 to 64 percent during that period. An additional indication of the growing acceptance of singleness among young adults is seen in the fact that since 1970, the proportion of men and women 25 to 29 years old who were never married increased after showing no significant change between 1960 and 1970.

Another measure which reflects this trend of postponing marriage is the estimated median age at which first marriage occurs¹. In 1977, the estimated median age at first marriage was 24.0 for men and 21.6 for women (tables B and C). These figures represent an increase for both sexes of 1 full year since the mid-1960's.

Estimates of the quartile ages at first marriage (the ages by which one-fourth and three-fourths of those who ever marry do so) also show a movement away from early first marriages, particularly for women. Women have traditionally married within a shorter range of years than men but recent data indicate that this difference is lessening. This inter-quartile range was 6.1 years for women in 1977 and 4.4 years in 1970; for men comparable estimates were 6.4 years for 1977 and 6.1 years for 1970. Thus, the central span of

¹This estimate is made on the assumption that marriage will ultimately be as prevalent as in the recent past (e.g., that about 95 percent of all adults will ever marry) and is the age at which one-half of those who ever marry may be expected to do so.

years within which approximately 25 to 75 percent of all first marriages occur has shown substantial change for women and relative stability for men.

NONFAMILY HOUSEHOLDS

A marked increase in nonfamily living arrangements among the adult population has been observed in recent years. Much of this increase has been accounted for by young men and women and seems to be directly associated with the postponement of marriage.

There were 17.7 million persons in 1977 who maintained their own household while living alone or with people unrelated to them (table D). Nine of every ten of these "primary individuals" lived alone with the vast majority of the remainder sharing their living quarters with one other person. The number of primary individual households increased by nearly 50 percent between 1970 and 1977, as compared with a 10-percent growth rate for family households.² Of the 1.7 million 2-person primary individual households, 43 percent had an unrelated man and woman sharing the home; there were an estimated 754,000 of these households in 1977, more than double the 327,000 in 1970.

Among the notable increases in the number of households shared by pairs of unrelated men and women was that for households maintained by persons under the age of 25.

²See Current Population Reports, Series P-20, No. 313.

¹Figures for 1947 to 1977 are based on Current Population Survey data supplemented by data from the Department of Defense on marital status by age for men in the Armed Forces. Figures for earlier dates are from decennial censuses.

Many of the young people who adopt this living arrangement are in a temporary or transitional situation which serves as a prelude to entering into more conventional family living. Although the Census Bureau does not collect information on the nature of the personal relationship between these unmarried couples, it seems likely that most of them were partners, roommates, companions, or friends.

DIVORCE RATIO

Another major development in marriage trends has been the sharply increasing level of divorce. In March 1977, there were an estimated 8.1 million men and women who were divorced and who had not remarried compared to 48 million married couples; there were 84 divorced persons for every 1,000 persons in an intact marriage in 1977 (table E). The dramatic upsurge in divorce has been a relatively recent development; since 1970 the divorce ratio has increased by 79 percent, as compared with an increase of 34 percent during the entire decade from 1960 to 1970. Although Blacks had a higher

divorce ratio than Whites in 1977, the proportional increase between the two groups during the 17 years from 1960 to 1977 was very similar; the ratio for Blacks had risen by 160 percent and that for Whites by 136 percent. In 1977, women had higher divorce ratios (101 per 1,000) than men (66 per 1,000) and persons under 45 had higher ratios (91 per 1,000) than those 45 years and over (76 per 1,000). These latter two developments reflect the facts that (1) women have a longer average duration of divorce before remarriage and a lower incidence of remarriage than men; and (2) most of the recent increase in divorce has been among younger couples.

FAMILIES MAINTAINED BY PERSONS WITH NO SPOUSE PRESENT

Families maintained by either men or women who have no spouse living with them represent a growing proportion of all families. There were one-third again as many of these families in 1977 as in 1970 (table F). Much of this recent

¹1970 Census of Population, Vol. II, PC(2)-4B, Persons by Family Characteristics.

increase has been a consequence of the rising level of separation and divorce. During the 7 years since 1970 the largest proportional increase has been for divorced persons maintaining families, their numbers having doubled in that span of years.

Five of every six persons maintaining families with no spouse present were women. This finding reflects the higher remarriage rate for men as well as a greater propensity for wives to retain the children when marriages are dissolved. At the same time, the number of divorced men living alone has rapidly increased from 688,000 in 1970 to 1,335,000 in 1977. The number of single (never-married) women maintaining families increased by 71 percent between 1970 and 1977, somewhat less than the level of increase recorded for divorced women during this period. Since single and divorced women are relatively young as compared with women who are widows, and since the number of widows maintaining families has remained constant during the last 7 years, the median age of women maintaining families has declined from 48 years old in 1970 to 43 years old in 1977.

The Census Bureau defines a family as a group of two or more persons who live together and who are related by blood, marriage, or adoption. Therefore, families maintained by a man or a woman with no wife or husband present are not necessarily single-parent families. In addition to parent-child groups these families may consist of such other groups of family members as sister-brother, sister-sister or grand-

parent-grandchild. Fifty-seven percent of these families not maintained by a married couple had own children under 18 years old present in 1977 (32 percent of all families maintained by men and 62 percent of those maintained by women).

LIVING ARRANGEMENTS OF CHILDREN

Although there were 5.4 million fewer persons under 18 in 1977 than in 1970, the number of children under 18 living only with their mother increased by 3 million. The overall decline in the youthful population is a consequence of the falling birth rate but changes in the living arrangements of children are a function of the marital status of their parents.

In 1970, 85 percent of all children under 18 lived with two parents; by 1977 this proportion had declined to 79 percent (table G).³ Since most children who do not live

³About 67 percent of all children under 18 years old in 1975 were living with both of their natural parents in their first marriage, according to U.S. Bureau of the Census, *Current Population Reports, Series P-20, No. 312, "Marriage, Divorce, Widowhood, and Remarriage by Family Characteristics,"* table R. In 1971, about two-thirds of the children of remarried parents were living with a step-parent and the other one-third with both natural parents (born after their parent(s) remarried), according to Series P-20, No. 263, "Fertility Histories and Birth Expectations of American Women: June 1971," table 59.

Table E. Number of Divorced Persons Per 1,000 Married Persons With Spouse Present by Age, Race, and Sex: March 1977, 1970, 1965, and 1960

¹Black and other races.

with both parents live with their mother only, the proportion of children living with only a female parent increased from 11 percent to 16 percent during the 1970-77 period. The percent of persons under 18 living with their father only or with neither parent has risen only marginally since 1970. As expected, because of recent trends in marriage patterns, the largest percent increases over the past 7 years among children living with a mother only were for children with a divorced or a never-married mother.

RELATED REPORTS

Data for 1977 and earlier years on households and families by type were published in Series P-20, No. 313. Results of a study on the marital history of men and women are provided in Series P-20, No. 297, "Number, Timing, and Duration of Marriages and Divorces in the United States: June 1975" and Series P-20, No. 312, "Marriage, Divorce, Widowhood, and Remarriage by Family Characteristics:

June 1975." Statistics on the characteristics of female heads of families and the members of their families for 1973 and earlier years are presented in Series P-23, No. 50, "Female Family Heads."

Figures for 1976 on marital status and family status were issued in Series P-20, Nos. 306 and 311. Figures on projections for the United States of the number of households and families from 1975 to 1990 have been published in Series P-25, No. 607. Additional statistics for years since 1947 on subjects covered in this report have been published by the Bureau of the Census in other reports in Series P-20.

Statistics on marital status for 1970 for standard metropolitan statistical areas, counties, urbanized areas, cities, States, regions, and the United States are presented in **1970 Census of Population, Volume I, Characteristics of the Population**, chapter B, "General Population Characteristics." Detailed statistics on marital status and presence of spouse by age for 1970 for States and for large counties and standard metropolitan statistical areas are presented in Volume I, chapter D, "Detailed Characteristics." Similar data for the United States and regions, for 1960, were published in **1960 Census of Population, Volume I, Characteristics of the Population, United States Summary**.

The 1970 census report Series PC(2)-4B, **Persons by Family Characteristics**, presents statistics on the marital and family status of persons 14 years old and over, by age, race, and sex, for the United States as a whole and for urbanized areas, and on persons under 18 years old by presence and marital status of parents, for the United States by type of residence, and for regions. In additions, this report shows all family members by age, sex, and family relationship by characteristics of the families of which they are members, including size of family, number of children, and education, occupation, and income of the family head.

The 1970 census report Series PC(2)-4C, **Marital Status**, shows detailed statistics on the marital status distribution of the population 14 years old and over by selected social and economic characteristics for the United States. Series PC(2)-4D, **Age at First Marriage**, contains detailed statistics for the United States on characteristics of persons 14 years old and over by age at first marriage, based on answers to questions on date of first marriage. In addition, the report shows average annual rates of first marriage per 1,000 single persons 14 to 79 years old in 1968 and 1969 for States. Statistics for 1970 on women by marital status, number of children ever born, and age at first marriage, are presented for the United States in Series PC(2)-3A, **Women by Number of Children Ever Born**.

Table G. Living Arrangements of Persons Under 18 Years Old: 1977 and 1970

(Numbers in thousands. For meaning of symbols, see text)

Living arrangements and marital status of mother	1977	1970	Percent change, 1970 to 1977
Total persons under 18 ¹	64,062	69,458	-7.8
In families.....	63,655	68,685	-7.3

¹Excludes persons under 18 years old who were heads or wives of heads of families or sub-families. Figures for 1970 include inmates of institutions. Inmates were excluded from CPS coverage beginning in 1972.

NOTE

In the past the Census Bureau has designated a head of household to serve as the central reference person for the collection and tabulation of data for individual members of the household (or family). However, recent social changes have resulted in a trend toward recognition of more equal status for all members of the household (or family), making the term "head" less relevant in the analysis of household and family data. As a result, the Bureau is currently developing new techniques of enumeration and data presentation which will eliminate the concept of "head." While much of the data in this report are based on the concept of "head," methodology for future Census Bureau reports will reflect a gradual movement away from this traditional practice.

Table 1. MARITAL STATUS, BY AGE, RACE AND SPANISH ORIGIN, FARM-NONFARM RESIDENCE, AND SEX: MARCH 1977

(Numbers in thousands. This report excludes inmates of institutions. It includes 954,000 members of the Armed Forces in 1977 who were living off post or with their families on post but excludes all other members of the Armed Forces. For meaning of symbols, see text)

Appendix

DEFINITIONS AND EXPLANATIONS

Coverage. The population in this report includes the civilian noninstitutional population of the United States plus approximately 954,000 members of the Armed Forces in the United States living off post or with their families on post in 1977, but excludes all other members of the Armed Forces. However, the data in tables B and C on median and quartile ages at first marriage for males refer to the total male population, which includes, in addition to the above, the male members of the Armed Forces overseas and in military barracks and similar quarters in the United States.

Symbols. A dash “—” represents zero or rounds to zero. The symbol “B” means that the base for the derived figure is less than 75,000. Three dots “. . .” mean not applicable, and “NA” means not available.

Rounding of estimates. Individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

Farm-nonfarm residence. The farm population refers to rural residents living on farms. The method of determining farm-nonfarm residence in the present survey and in the Current Population Surveys (CPS) since March 1960 is the same as that used in the 1960 and 1970 censuses but differs from that used in earlier surveys and censuses. Since March 1960 in the CPS, farm residence has been determined by the responses to two questions. Owners are asked “Does this place have 10 or more acres?” and renters are asked “Does the place you rent have 10 or more acres?” If the response is “Yes,” the respondent is asked “During the past 12 months, did sales of crops, livestock, and other farm products from this place amount to \$50 or more?” If the acreage response is “No,” the inquiry relates to sales of \$250 or more. Rural persons in motels and tourist camps, and those living on rented places where no land is used for farming, are not classified as farm population. The nonfarm population, as the term is used here, comprises persons living in urban areas and rural persons not on farms.

Although the method of determining farm-nonfarm residence has not changed since March 1960, the underlying

sampling methods and estimation procedures have changed. For a discussion of changes see **Employment and Earnings, Volume 18**, No. 8, February 1972, pp. 6-9, published by the Bureau of Labor Statistics.

Age. The age classification is based on the age of the person at the person's last birthday.

Race. The population is divided into three groups on the basis of race: White, Black, and “other races.” The last category includes Indians, Japanese, Chinese, and any other race except White and Black.

Persons of Spanish origin. Persons of Spanish origin in this report were determined on the basis of a question that asked for self-identification of the person's origin or descent. Respondents were asked to select their origin (or the origin of some other household member) from a “flash card” listing ethnic origins. Persons of Spanish origin, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Cuban, Central or South American, or some other Spanish origin.

Marital status. The marital status classification identifies four major categories: single, married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category “married” is further divided into “married, spouse present,” “separated,” and “other married, spouse absent.” A person was classified as “married, spouse present” if the husband or wife was reported as a member of the household, even though he or she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as separated included those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily separated because of marital discord. The group “other married, spouse absent” includes married persons living apart because either the husband or wife was employed and living at a considerable distance from home, was serving away from home in the Armed Forces, had moved to another area, or had a different place of residence for any other reason except separation as defined above.

Husband in Armed Forces. When a woman was reported as married but her husband was not enumerated as a member of the same household, an additional question was asked to determine whether her husband was in the Armed Forces. Women who were reported as separated were not asked the additional question.

Age at first marriage. The median age at first marriage, as shown in this report, is an approximation derived indirectly from tabulations of marital status and age. In computing this median, several steps are involved. First, the expected proportion of young people who will ever marry during their lifetime is computed. Second, one-half this expected proportion is calculated. Third, the current age of young people who are at this halfway mark is computed. From the assumptions made and the procedures used, it follows that the date of the survey is also the date when this halfway mark is reached. Half of the young people of the given age who will ever get married had done so prior to the survey date and half are expected to marry in years to come.

The quartile ages at first marriage divide people who will ever marry into four equal groups. The first quartile age is the age at which 25 percent of persons have married, the second quartile age (or median age) is the age at which 50 percent of persons have married, and the third quartile age is the age at which 75 percent of persons have married. The quartile ages are computed from the same distributions and involve the same assumptions as do the median ages.

In estimating the proportion of young people who will eventually marry, errors of 3 or 4 percentage points would affect the final estimate of the median age at first marriage by only 0.1 or 0.2 of a year. For convenience, the proportion ever married among persons 45 to 54 years old was used. Other age combinations could have been used with little change in the results, so long as they included very few persons who would subsequently marry for the first time.

Data on marital status were available by single years of age in censuses and by 5-year age groups in the sample surveys. Sprague's fifth difference interpolation formula was used to estimate the percent ever married by tenths of a year of age from census figures and from the sample survey data. Since the interpolation was based on the percent ever married for 5-year age groups in the survey data, and since this percent is sensitive to changes in the distribution by single years of age within the age groups when most first marriages take place, the resulting median age at first marriage from the survey may fluctuate sharply in response to the major changes that have recently taken place in the age composition of the 20- to 24-year-old age group.

The median age at first marriage computed from data on either annual marriage records or census questions on age at first marriage involves people over the full age span rather than just those in the vicinity of the halfway point. Median ages at first marriage based on these other records may be affected by changes in the age distribution of the popula-

tion, whereas the median age at first marriage for a given date shown in the present report can be interpreted as applying to the cohort born "n" years earlier, where "n" is the median age at first marriage. Data on age at first marriage are available from marriage records only for certain States and from census questions only for selected dates.

When the figures on median and quartile ages at first marriage for different years are compared, caution should be exercised in the interpretation of small changes. Because of sampling variability of the survey data and the limitations of the estimating technique itself, the errors in the estimates of the median age may be slightly larger than annual changes of one- or two-tenths of a year of age. Moreover, there is evidence that computation of the median age at first marriage for men in some years is affected by changes in the distribution by single years of age within the age groups when most first marriages take place; changes of up to one-half year in the median for men may reflect this factor rather than any real change taking place in the ages of men at first marriage.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment, or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Group quarters. Group quarters are now defined in the CPS as noninstitutional living arrangements for groups not living in conventional housing units or groups living in housing units containing five or more persons unrelated to the person in charge. Inmates of institutions (starting in 1972) are not included in the CPS.

Family status. Within households, persons who are family members are distinguished from those who are not family members. A family is defined as a group of two or more persons residing together who are related by blood, marriage, or adoption; all such persons are considered as members of one family even though they may include a "subfamily," that is, a married couple or a parent-child group sharing the living quarters of the married couple or person maintaining the household. A primary family includes among its members the married couple or person maintaining a household, and a "secondary family" includes no member related to the person or persons maintaining the

household. Members of secondary families may include persons such as lodgers, guests, or resident employees and their relatives living in a household.

Persons living with relatives in group quarters were formerly considered as members of secondary families. However, the number of such families became so small (37,000 in 1967) that beginning with CPS data for 1968 (and beginning with census data for 1960) the Bureau of the Census includes persons in these families in the count of secondary individuals.

In this report, persons who are not family members (that is, are not recognized as living with any relatives) are "unrelated individuals." Unrelated individuals are of two types—primary and secondary. A "primary individual" is a person maintaining a household with no relatives in the household. A "secondary individual" is a lodger, partner, guest, or resident employee with no relatives in the household or group quarters.

Income. For the noninstitutional population 14 years old and over, questions were asked on the amount of money income received in 1976. The amounts received represent income before deductions for personal taxes, Social Security, bonds, etc. Although the income statistics refer to receipts during 1976, the characteristics of the person, such as age, marital status, etc., refer to March 1977.

Years of school completed. In this report, data on years of school completed were derived from the combination of answers to two questions, (a) "What is the highest grade of school that the person has attended?" and (b) "Did the person finish this grade?"

The questions on educational attainment applied only to progress in "regular" schools. Such schools include public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus,

"regular" schooling is that which advances a person toward an elementary or high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of Data

Most of the estimates in this report are based on data from the Bureau of the Census collected in the Current Population Survey (CPS), supplemented by data from the Department of Defense. Data shown in the tables based on Decennial Censuses are footnoted.

Current population survey (CPS). The present CPS sample was initially selected from the 1970 census files and is updated continuously to reflect new construction where possible (see section "Nonsampling Variability" below). The monthly CPS sample is spread over 461 areas with coverage in each of the 50 States and the District of Columbia. A supplementary sample of housing units in 24 States and the District of Columbia was incorporated with the monthly CPS sample to produce the March 1977 data. The expanded CPS sample is located in 614 areas comprising 1,113 counties, independent cities, and divisions in the nation. The 614 sample areas used in March include 461 areas from the monthly CPS and 153 supplementary areas.

Samples for previous sample designs were selected from files from the most recently completed census. The following table provides a description of some aspects of the CPS sample designs in use during the referenced data-collection periods.

Description of the Current Population Survey

Time period	Number of sample areas ¹	Households eligible		Households visited, not eligible ²
		Interviewed	Not interviewed	
January 1967 to July 1971.....	449	48,000	2,000	8,500
August 1971 to July 1972.....	449	45,000	2,000	8,000
August 1972 to present.....	461	45,000	2,000	8,000
Supplemental sample.....	153	8,500	500	1,500

¹These areas were chosen to provide coverage in each State and the District of Columbia, with the exception of the supplementary sample used for March 1977 data.

²These are households which were visited, but were found to be vacant or otherwise not eligible for interview.

The estimation procedure used for the monthly CPS data involves the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from decennial censuses; statistics on births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces. For the estimates in this report persons in the Armed Forces were also included. The estimation procedure for the data in the report also involved a further adjustment so that husband and wife of a household received the same weight.

Decennial census of population. Decennial census data in this report are based on complete counts or on the samples associated with the census as indicated in the list of sources. Descriptions of samples from the census are found in the appropriate census publications. To determine if the census data in a table of this report are based on complete counts or on the samples associated with the census, refer to the source of data at the bottom of that table.

RELIABILITY OF THE ESTIMATES

Since the estimates in this report are based on a sample, they may differ somewhat from the figures that would have been obtained had a complete census been taken using the same schedule, instructions and enumerators. There are two types of errors possible in an estimate based on a sample survey--sampling and nonsampling. The standard errors provided for this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data. The full extent of the nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

Nonsampling variability. Nonsampling errors in surveys can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness of respondents to provide correct information, inability to recall information, errors made in collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Overall undercoverage, as compared to the level of the decennial census, is about 5 percent. It is known that CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races than for Whites. Ratio estimation to independent age-sex-race population controls, as described

previously, partially corrects for the biases due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics than interviewed persons in the same age-sex-race group. Further, the independent population controls used have not been adjusted for undercoverage in the 1970 census, which was estimated at 2.5 percent of the population with similar undercoverage differentials by age, sex, and race as is observed in CPS.

The approximate magnitude of two sources of undercoverage of housing units is known. Of the 83,000,000 housing units in the U.S. about 600,000 new construction housing units other than mobile homes are not represented in the CPS sample because they were assigned building permits prior to the 1970 census, but building was not completed by the time of the census (i.e., April 1970). Most conventional new construction, for which building permits were issued after the census, is represented. About 290,000 occupied mobile homes are not represented in CPS; these units were either missed in the census or have been built or occupied since the census. These estimates of missed units are relevant to the present sample only and not to earlier designs where the extent of undercoverage was generally less. The extent of other sources of undercoverage of housing units is unknown but believed to be small.

Sampling variability. The standard errors given in the following tables are primarily measures of sampling variability, that is, of the variations that occurred by chance because a sample rather than the whole of the population was surveyed. The chances are about 68 out of 100 that an estimate from the survey differs from a complete census by less than the standard error. The chances are about 90 out of 100 that this difference would be less than 1.6 times the standard error and about 95 out of 100 that the difference would be less than twice the standard error.

All the statements of comparison appearing in the text are significant at a 1.6 standard error level or better, and most are significant at a level of more than 2.0 standard errors. This means that for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by use of the phrase, "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

Note when using small estimates. Percent distributions are shown in the report only when the base is 75,000 or greater. Because of the large standard errors involved there is little chance that percentages would reveal useful information when computed on a smaller base. Estimated numbers are shown however, even though the relative standard errors of these numbers are larger than those for the corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's needs.

Comparability with other data. Caution should be used in comparing estimates from the expanded sample and estimates using the national sample only. The use of the supplemental sample has resulted in some differences in estimates as compared to using the national sample only. However, most of the differences are within sampling error with the major exception being estimates of Black and other races by metropolitan categories where there has been a decrease in metropolitan areas and an increase in nonmetropolitan areas.

Data obtained from the CPS and other governmental sources are not entirely comparable. This is due in large part to differences in interviewer training and experience and in differing survey processes. This is an additional component of error not reflected in the standard error tables. Therefore, caution should be used in comparing results between these different sources.

Standard errors for data based on the decennial census. Sampling errors of all data from the samples of the 1970 Decennial Census shown in this report are small enough to be disregarded.

Standard error tables and their use. In order to derive standard errors that would be applicable to a large number of estimates and could be prepared at a moderate cost, a number of approximations were required. Therefore, instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result, the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error.

The figures presented in tables A-1 through A-4 are approximations to standard errors of various estimates shown in this report. Estimated standard errors for specific characteristics cannot be obtained from tables A-1 through A-4 without the use of the factors in table A-5. These factors must be applied to the generalized standard errors in order to adjust for the combined effect of sample design and estimating procedure on the value of the characteristic. Standard errors for intermediate values not shown in the generalized tables of standard errors may be approximated by interpolation.

Table A-1. Standard Errors of Estimated Numbers, Total, White or Spanish Origin

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
20.....	8	2,500.....	93
30.....	10	5,000.....	131
50.....	13	10,000.....	182
100.....	19	25,000.....	277
250.....	30	50,000.....	364
500.....	42	100,000 ¹	424
1,000.....	59		

Note: For a particular characteristic see table A-5 for the appropriate factor to apply to the above standard errors.

¹For estimates larger than 100,000,000, multiply the estimate by 0.004 to get the standard error. Use of formula (2) and the parameters in table A-6 will give more accurate results.

Table A-2. Standard Errors of Estimated Numbers, Black and Other Races

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
20.....	10	500.....	50
30.....	12	1,000.....	69
50.....	16	2,500.....	106
100.....	22	5,000.....	141
250.....	35	10,000 ¹	171

Note: For a particular characteristic see table A-5 for the appropriate factor to apply to the above standard errors.

¹For estimates larger than 10,000,000, multiply the estimate by 0.02 to get the standard error. Use of formula (2) and the parameters in table A-6 will give more accurate results.

Two parameters are used (denoted "a" and "b") to calculate standard errors for each type of characteristic; they are presented in table A-6. These parameters were used to calculate the standard errors in tables A-1 through A-4 and to calculate the factors in table A-5. They also may be used to directly calculate the standard errors for estimated numbers and percentages. Direct computation of the standard errors will give more accurate results than the use of the standard error tables. Methods for direct computation are given in the following sections.

Standard Errors of Estimated Numbers. The approximate standard error, σ_x , of an estimated number shown in this

$$\sigma_x = f\sigma \quad (1)$$

report can be obtained in two ways. It may be obtained by use of the formula

where f is the appropriate factor from table A-5, and σ is the standard error on the estimate obtained by interpolation from table A-1 or A-2. Alternatively, standard errors may be approximated by the following formula, (2), from which the standard errors were calculated in tables A-1 and A-2. Use of this formula will provide more accurate results than the use of formula (1) above.

$$\sigma_x = \sqrt{ax^2 + bx} \quad (2)$$

Here x is the size of the estimate and a and b are the parameters in table A-6 associated with the particular type of characteristic.

Standard errors of estimated percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends on both the size of the percentage and the size of the total upon which this percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameters indicated by the numerator. The approximate standard error, $\sigma_{(x,p)}$, of an estimated percentage can be obtained by use of the formula

$$\sigma_{(x,p)} = f\sigma \quad (3)$$

In this formula f is the appropriate factor from table A-5 and σ is the standard error on the estimate from either table A-3 or A-4. Alternatively, standard errors may be approximated by the following formula, (4), from which the standard errors in tables A-3 and A-4 were calculated; direct computation will give more accurate results than use of the standard error tables and the factors.

$$\sigma_{(x,p)} = \sqrt{\frac{b}{x} \cdot p(100-p)} \quad (4)$$

Table A-3. Standard Errors of Estimated Percentages, Total, White or Spanish Origin

(68 chances out of 100)

Base of estimated percentage (thousands)	Estimated percentage								
	1 or 99	2 or 98	5 or 95	10 or 90	15 or 85	20 or 80	25 or 75	35 or 65	50
100.....	1.9	2.6	4.1	5.6	6.7	7.5	8.1	8.9	9.4
250.....	1.2	1.7	2.6	3.5	4.2	4.7	5.1	5.6	5.9

Note: For a particular characteristic see table A-5 for the appropriate factor to apply to the above standard errors.

Here x is the size of the subclass of persons or families and unrelated individuals which is the base of the percentage, p is the percentage ($0 \leq p \leq 100$), and b is the parameter in table F associated with the particular type of characteristic in the numerator of the percentage.

Estimates of divorced persons per 1,000 married persons with spouse present. The standard error on an estimate of the number of divorced persons per 1,000 married persons with spouse present cannot be calculated directly from these standard error tables. The estimate involves the ratio of the total persons divorced, x , to the total number of married persons with spouse present, y , multiplied by 1,000. The standard error of this estimate is calculated by the following formula:

$$\sigma_{\left[\frac{x}{y} (1,000)\right]} = (1,000) \sqrt{\left(\frac{x}{y}\right)^2 \left(\frac{\sigma_x^2}{x^2} + \frac{\sigma_y^2}{y^2}\right)} \quad (5)$$

The standard errors of the estimates of the total number of divorced persons, σ_x , and the standard error of the total number of married persons with spouse present, σ_y , should both be calculated using table A-1 and factor table A-5 or formula (2).

Illustration of the use of tables of standard errors. Table D of this report shows that there were 1,039,000 single men of

all ages that were primary individuals in two-person households as of March 1977. Interpolation in table A-1 shows the standard error (σ_x) on an estimate of this size to be approximately 60,000. The factor in table A-5 for total or White primary individuals in the United States is 0.6, thus the standard error is approximately 36,000 = 60,000 x 0.6. The chances are 68 out of 100 that the estimate would have been a figure differing from a complete census figure by less than 36,000 and 95 out of 100 that the estimate would be within 72,000 of a census figure. Alternatively, using formula (2) and the parameters $a = -0.000010$ and $b = 1,389$ from table A-6 gives an estimate of the standard error of 38,000.

Table D also shows that of these 1,039,000 men of all ages, 489,000 or 47.1 percent were sharing a household with an unrelated female. Table A-6 shows the b parameter for total or primary individuals is 1,389; using formula (4) the standard error on an estimate of 47.1 percent is

$$\sqrt{\left(\frac{1,389}{1,039,000}\right)^2 \times (47.1) (100-47.1)} = 1.8 \text{ percent}$$

Consequently, chances are 68 out of 100 that the estimated 47.1 percent would be within 1.8 percentage points of a complete census figure and 95 out of 100 that the estimate would be within 3.6 percentage points of a census figure; i.e., the 95-percent confidence interval would be from 43.5 to 50.7 percent. As an alternative, tables A-3 and A-5 can be

Table A-4. Standard Errors of Estimated Percentages, Black and Other Races

(68 chances out of 100)

Base of estimated percentage (thousands)	Estimated percentage								
	1 or 99	2 or 98	5 or 95	10 or 90	15 or 85	20 or 80	25 or 75	35 or 65	50

25,000.....	0.14	0.2	0.3	0.4	0.5	0.6	0.6	0.7	0.7

Note: For a particular characteristic see table A-5 for the appropriate factor to apply to the above standard errors.

used to compute an estimated standard error of $3.0 \times 0.6 = 1.8$ percent on the estimate of 47.1 percent.

Standard error of a difference. For a difference between two sample estimates, the standard error is approximately equal to

$$\sigma_{(x-y)} = \sqrt{\sigma_x^2 + \sigma_y^2} \quad (6)$$

where σ_x and σ_y are the standard errors of the estimates x and y ; the estimates can be of numbers, percents, ratios, etc. This will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will overestimate the true standard error.

Illustration of the computation of the standard error of a difference between estimated numbers. Table D of the report shows that in 1977 there were 700,000 women of all ages that were primary individuals in two-person households. Thus the apparent difference between the number of men and women of all ages that were primary individuals in

two-person households in 1977 is 339,000. The standard error (σ_x) of 1,039,000 is 36,000 as shown above. Table A-1 and factor table A-5 show the standard error (σ_y) on an estimate of 700,000 to be approximately 29,000.

To obtain the standard error of an estimated difference, use formula (6). Therefore, the standard error of the estimated difference of 339,000 is about

$$46,000 \doteq \sqrt{(36,000)^2 + (29,000)^2}$$

This means the chances are 68 out of 100 that the estimated difference based on the sample estimates would vary from the difference derived using complete census figures by less than 46,000. The 68-percent confidence interval around the 339,000 difference is from 293,000 to 385,000, i.e., $339,000 \pm 46,000$. The 95-percent confidence interval is from 247,000 to 431,000; since this interval does not include zero we can conclude with 95-percent confidence that the number of men of all ages that were primary individuals in two-person households in 1977 is actually greater than the number of women of all ages that were primary individuals in 1977.

Table A-5. Factors to be Applied to Tables A-1 Through A-4 to Estimate Standard Errors of Family or Marital Status Characteristics

Characteristic	CPS data collected January 1967 to present ¹

¹To estimate standard errors for the period 1957 to 1966, multiply the above factors by 1.2.

²Apply these factors to table A-1 or table A-3.

Standard error of age at first marriage. Tables B and C of this report show age at first marriage by quartiles for selected years. Due to the complexity of the calculations, the procedure for determining standard errors on quartiles is not

given here. An explanation of how the quartiles are calculated and their limitations is discussed in the Age at first marriage part of the **Definitions and Explanations** section of this report.
