Marital Status and Living Arrangements: March 1978

INTRODUCTION

This is the first of two reports presenting survey results for March 1978 on selected characteristics of persons (sex, age, marital status, living arrangements, race and Spanish origin) and households and families (size, type, and composition). The central focus of this report is the description of the living arrangements and general social and demographic status of individuals. A second detailed report, "Household and Family Characteristics: March 1978," will primarily concentrate on the household and/or the family as the unit of analysis.

Data contained in this report reflect the impact of various factors on the behavior of men and women regarding marriage, divorce, and living arrangements, as of the survey date. These factors include a variety of social, economic, technological, demographic, and psychological developments.

The text features trends which reflect increases in the following:

- The age at first marriage and the proportion of young adults remaining single.

- The ratio of divorced persons to persons in intact marriages.
- The number of households maintained by "unmarried couples."
- One-person households, families maintained by women with no husband present, and children living with only one parent.

AGE AT FIRST MARRIAGE

Indirect estimates of the median ages at which young men and women first marry are presented for a series of years in table A. These measures generally reflect the increasing tendency for young adults to at least postpone first marriage beyond the most prevalent ages for initial entry into-marriage in the recent past. Thus, the estimates indicate that there has been an increase of about 1 full year in the typical age at first marriage for men and women since 1970. The 1978 calculations show an estimated median age at first marriage of 24.2 years for men and 21.8 years for women.

Table A. Median Age at First Marriage, by Sex: 1890 to 1978

Source of 1960 data: 1960 Census of Population, Vol. 1, "Detailed Characteristics", U.S. Summary, table 176.

Another perspective from which to view the extent to which young adults are postponing marriage is to compare the proportion of young women who had never married as of 1978 with young women who had never married as of 1970 and 1960. Slightly less than half (48 percent) of the women in 1978 who were 20 to 24 years of age had never been married, an increase of two-thirds in the proportion single since 1960 (table B). Moreover, since 1970, the proportion of these young adult women who were single increased by about one-third.

Data for women in their late twenties also reflect a substantial increase in the proportion remaining single. After showing no change during the 1960-70 decade, the proportion of women 25 to 29 years of age who never married rose from 10.5 percent in 1970 to 18.0 percent in 1978.

Although not shown in the table, the proportion single among men in their twenties also increased between 1960 and 1978 by one-fourth for men 20 to 24 years (from 53 percent to 66 percent), and by one-third for men 25 to 29 years (from 21 percent to 28 percent).

This pattern of postponement of first marriage may indicate an increasing desire among young adults (both women and men) to pursue nonfamilial interests such as advanced education and labor force careers before marrying. At the same time, the trend does not necessarily portend a sharp rise in lifelong singleness, although a slight increase in this marital status may be expected.

DIVORCE RATIO CONTINUES TO RISE

As analytically interesting and dramatic as the rise in non-marriage among young adults has been, the increase in the level of marital dissolution through divorce during recent years has seemed to some to be even more spectacular and serious in its consequences. One measure of the extent to which divorce has increased is found in the period measure of the number of divorced persons per 1,000 persons married and living with their spouse.

In March 1978, there were an estimated 90 divorced persons for every 1,000 persons who were living as husbands

or wives in intact marriages. This ratio represents a 91-percent increase over the 1970 level of 47 divorced persons per 1,000 persons who were married and living with their spouse, and a 157-percent increase over the 1960 level (35 per 1,000). Table C shows that the ratio has risen for both sexes, for Blacks and Whites, and for all age groups shown. The ratio has risen most dramatically since the beginning of this decade and by age most particularly among adults 30 to 44. In 1978 the ratios were higher for ages under 45 than for those 45 and over, thus, representing a reversal of the situation during 1960 and 1970 when the highest ratios were for those 45 years and over. By way of comparison, the ratios for persons under 30 years old increased by 296 percent between 1960 and 1978 while the amount of increase for persons aged 45 to 64 years was 83 percent during the same 18-year period. In 1978, women had higher divorce ratios than men (110 per 1,000 as compared with 71 per 1,000) and Blacks had higher ratios than Whites (194 per 1,000 versus 83 per 1,000). Black women had the single highest 1978 ratio of divorced per 1,000 married and living with a spouse, 246.

RISE IN NUMBER OF UNMARRIED COUPLES

Changes in the frequency with which and ages at which people marry (or dissolve marriages) have a direct bearing on the living arrangements of the population. One type of living arrangement which seems to reflect recent marital trends is the increase in the number of households which contain two unrelated adults of opposite sexes. In 1978, there were

an estimated 1.1 million "unmarried-couple" households, a 117-percent increase since 1970 when there were an estimated 523,000 households of this type (table D). Three-fourths of the unmarried-couple households in 1978 consisted solely of the two partners, and one-fourth of the couples had one or more children living with them. Among unmarried couples with no children present in their households, approximately two-thirds reported the man as the householder. Most of the growth in the number of unmarried couples during this decade has been among those with no children present. Thus, while unmarried couples with no children present increased by 165 percent between 1970 and 1978, those with children present increased by only 39 percent. Table E shows that in 7 of every 10 two-person unmarried-couple households, both partners were under the age of 45, and generally, the vast majority of unrelated partners were very nearly in the same age range.

INCREASES IN ONE-PERSON HOUSEHOLDS, WOMEN MAINTAINING FAMILIES, AND CHILDREN LIVING WITH ONLY ONE PARENT

Changes in living arrangements which have resulted from changes in marital status extend far beyond increases in unmarried couples. There have been significant increases in the number of persons living alone as one-person households, in the number of families maintained by women who have no husband living with them, and in the number of children living with only one parent.

¹Excludes persons under 18 years old who were heads or wives of heads of families or subfamilies. Figures for 1970 include inmates of institutions. Inmates were excluded from CPS coverage beginning in 1972.

Twenty-two percent of all U.S. households in 1978 were one-person households. More than 6 of every 10 of these households were maintained by women. However, the number of one-person households maintained by men has grown more rapidly since 1970 than those for women (table F). Most of the growth of this household type has been among householders who were under 35 years old.

In 1978, there were 8.0 million families maintained by women who were not living with a husband, a 44-percent increase over the 5.6 million such families in 1970 (table G). The number of these women who were reported as having never been married and the number who were reported as divorced doubled between 1970 and 1978. In 1978, 34 percent of the female family householders were divorced, 29 percent were widowed, and 15 percent were single. Corresponding figures for 1970 were 23 percent divorced, 43 percent widowed, and 11 percent single. The 5.7 million White families and the 2.2 million Black families maintained by women represented 71 percent and 28 percent, respectively, of all families maintained by women in 1978. During the 8 years since 1970, Black families with a female house-

holder increased by 65 percent, while White families maintained by a female householder increased by 36 percent.

An increasingly common life course event for children today is living in a family where only one parent is present. It has been estimated that nearly one-half of all children born today will spend a meaningful portion of their lives as children in a single-parent situation before they reach the age of 18 years.¹ In 1978, only 78 percent of all children under 18 lived with two parents as compared with 85 percent in 1970 (table H). Most children living with only one parent lived with the mother, and in most instances, the mother was divorced. Approximately 11 million children were living with their mother but not their father in 1978 as compared with about 1 million living with their father only. Although both situations have increased in number, contrary to some speculation, the frequency with which a child in a single-parent family is living with a father has increased no more in proportion to the number living with a mother.

¹Paul C. Glick and Arthur J. Norton, "Marrying, Divorcing, and Living Together in the U.S. Today," *Population Bulletin*, No. 5, Vol. 32, Population Reference Bureau Inc., Washington, D.C., 1977.

RELATED REPORTS

Data for 1978 and earlier years on households and families by type were published in Series P-20, No. 327. Results of a study on the marital history of men and women are provided in Series P-20, No. 297, "Number, Timing, and Duration of Marriages and Divorces in the United States: June 1975" and Series P-20, No. 312, "Marriage, Divorce, Widowhood, and Remarriage by Family Characteristics: June 1975." Statistics on the characteristics of female heads of families and the members of their families are presented in Series P-23, No. 50, "Female Family Heads." Information on married couples was recently published in Series P-23, No. 77, "Perspectives on American Husbands and Wives."

Figures for 1977 on marital status and family status were issued in Series P-20, Nos. 323 and 326. Figures on projections for the United States of the number of households and families from 1975 to 1990 have been published in Series P-25, No. 607. Additional statistics for years since 1947 on subjects covered in this report have been published by the Bureau of the Census in other reports in Series P-20.

Statistics on marital status for 1970 for standard metropolitan statistical areas, counties, urbanized areas, cities, States, regions, and the United States are presented in **1970 Census of Population, Volume I, Characteristics of the Population**, chapter B, "General Population Characteristics." Detailed statistics on marital status and presence of spouse by age for 1970 for States and for large counties and standard metropolitan statistical areas are presented in **Volume I**,

chapter D, "Detailed Characteristics." Similar data for the United States and regions, for 1960, were published in **1960 Census of Population, Volume I, Characteristics of the Population, United States Summary**.

The 1970 census report Series PC(2)-4B, **Persons by Family Characteristics**, presents statistics on the marital and family status of persons 14 years old and over, by age, race, and sex, for the United States as a whole and for urbanized areas, and on persons under 18 years old by presence and marital status of parents, for the United States by type of residence, and for regions. In addition, this report shows all family members by age, sex, and family relationship by characteristics of the families of which they are members, including size of family, number of children, and education, occupation, and income of the family head.

The 1970 census report Series PC(2)-4C, **Marital Status**, shows detailed statistics on the marital status distribution of the population 14 years old and over by selected social and economic characteristics for the United States. Series PC(2)-4D, **Age at First Marriage**, contains detailed statistics for the United States on characteristics of persons 14 years old and over by age at first marriage, based on answers to questions on date of first marriage. In addition, the report shows average annual rates of first marriage per 1,000 single persons 14 to 79 years old in 1968 and 1969 for States. Statistics for 1970 on women by marital status, number of children ever born, and age at first marriage, are presented for the United States in Series PC(2)-3A, **Women by Number of Children Ever Born**.

NOTE

In the past the Census Bureau has designated a head of household to serve as the central reference person for the collection and tabulation of data for each member of the household (or family). However, the trend toward recognition of equal status and roles for adult family members makes the term "head" less relevant in the analysis of household and family data. As a result, the Bureau is currently developing new techniques for the enumeration and presentation of data which will eliminate the concept "head." Although the data in this report are based on this concept, methodology for future Census Bureau reports will reflect a gradual movement away from this traditional practice.

Appendix

DEFINITIONS AND EXPLANATIONS

Coverage. The population in this report includes the civilian noninstitutional population of the United States plus approximately 874,000 members of the Armed Forces in the United States living off post or with their families on post in 1978, but excludes all other members of the Armed Forces. However, the data in table A on median age at first marriage for men refer to the total male population, which includes, in addition to the above, the male members of the Armed Forces overseas and in military barracks and similar quarters in the United States.

Symbols. A dash “—” represents zero or rounds to zero. The symbol “B” means that the base for the derived figure is less than 75,000. Three dots “...” mean not applicable, and “NA” means not available.

Rounding of estimates. Individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

Farm-nonfarm residence. The farm population refers to rural residents living on farms. The method of determining farm-nonfarm residence in the present survey and in the Current Population Surveys (CPS) since March 1960 is the same as that used in the 1960 and 1970 censuses but differs from that used in earlier surveys and censuses. Since March 1960 in the CPS, farm residence has been determined by the responses to two questions. Owners are asked “Does this place have 10 or more acres?” and renters are asked “Does the place you rent have 10 or more acres?” If the response is “Yes,” the respondent is asked “During the past 12 months, did sales of crops, livestock, and other farm products from this place amount to \$50 or more?” If the acreage response is “No,” the inquiry relates to sales of \$250 or more. Rural persons in motels and tourist camps, and those living on rented places where no land is used for farming, are not classified as farm population. The nonfarm population, as the term is used here, comprises persons living in urban areas and rural persons not on farms.

Although the method of determining farm-nonfarm residence has not changed since March 1960, the underlying sampling methods and estimation procedures have changed. For a discussion of changes see Employment and Earnings, Volume 18, No. 8, February 1972, pp. 6-9, published by the Bureau of Labor Statistics.

Age. The age classification is based on the age of the person at the person's last birthday.

Race. The population is divided into three groups on the basis of race: White, Black, and “other races.” The last category includes Indians, Japanese, Chinese, and any other race except White and Black.

Persons of Spanish origin. Persons of Spanish origin in this report were determined on the basis of a question that asked for self-identification of the person's origin or descent. Respondents were asked to select their origin (or the origin of some other household member) from a “flash card” listing ethnic origins. Persons of Spanish origin, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Cuban, Central or South American, or some other Spanish origin. Persons of Spanish origin may be of any race.

Marital status. The marital status classification identifies four major categories: single, married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category “married” is further divided into “married, spouse present,” “separated,” and “other married, spouse absent.” A person was classified as “married, spouse present” if the husband or wife was reported as a member of the household, even though he or she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as separated included those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily separated because of marital discord. The group “other married, spouse absent” includes married persons living apart because either the husband or wife was employed and living at a considerable distance from home, was serving away from home in the Armed Forces, had moved to another area, or had a different place of residence for any other reason except separation as defined above.

Husband in Armed Forces. When a woman was reported as married but her husband was not enumerated as a member of the same household, an additional question was asked to determine whether her husband was in the Armed Forces. Women who were reported as separated were not asked the additional question.

Age at first marriage. The median age at first marriage, as shown in this report, is an approximation derived indirectly from tabulations of marital status and age. In computing this median, several steps are involved. First, the expected proportion of young people who will ever marry during their lifetime is computed. Second, one-half this expected proportion is calculated. Third, the current age of young people who are at this halfway mark is computed. From the assumptions made and the procedures used, it follows that the date of the survey is also the date when this halfway mark is reached. Half of the young people of the given age who it is assumed will ever get married had done so prior to the survey date and half are expected to marry in years to come.

In estimating the proportion of young people who will eventually marry, errors of 3 or 4 percentage points would affect the final estimate of the median age at first marriage by only 0.1 or 0.2 of a year. For convenience, the proportion ever married among persons 45 to 54 years old was used. Other age combinations could have been used with little change in the results, so long as they included very few persons who would subsequently marry for the first time.

When the figures on median and quartile ages at first marriage for different years are compared, caution should be exercised in the interpretation of small changes. Because of sampling variability of the survey data and the limitations of the estimating technique itself, the errors in the estimates of the median age may be slightly larger than annual changes of one- or two-tenths of a year of age. Moreover, there is evidence that computation of the median age at first marriage for men in some years is affected by changes in the distribution by single years of age within the age groups when most first marriages take place; changes of up to one-half year in the median for men may reflect this factor rather than any real change taking place in the ages of men at first marriage.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment, or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Group quarters. Group quarters are now defined in the CPS as noninstitutional living arrangements for groups not living in conventional housing units or groups living in housing units containing five or more persons unrelated to

the person in charge. Inmates of institutions (starting in 1972) are not included in the CPS.

Family status. Within households, persons who are family members are distinguished from those who are not family members. A family is defined as a group of two or more persons residing together who are related by blood, marriage, or adoption; all such persons are considered as members of one family even though they may include a "subfamily," that is, a married couple or a parent-child group sharing the living quarters of the married couple or person maintaining the household. A primary family includes among its members the married couple or person maintaining a household, and a "secondary family" includes no member related to the person or persons maintaining the household. Members of secondary families may include persons such as lodgers, guests, or resident employees and their relatives living in a household.

Persons living with relatives in group quarters were formerly considered as members of secondary families. However, the number of such families became so small (37,000 in 1967) that beginning with CPS data for 1968 (and beginning with census data for 1960) the Bureau of the Census includes persons in these families in the count of secondary individuals.

In this report, persons who are not family members (that is, are not recognized as living with any relatives) are "unrelated individuals." Unrelated individuals are of two types—primary and secondary. A "primary individual" is a person maintaining a household with no relatives in the household. A "secondary individual" is a lodger, partner, guest, or resident employee with no relatives in the household or group quarters.

Income. For the noninstitutional population 14 years old and over, questions were asked on the amount of money income received in 1977. The amounts received represent income before deductions for personal taxes, Social Security, bonds, etc. Although the income statistics refer to receipts during 1977, the characteristics of the person, such as age, marital status, etc., refer to March 1978.

Years of school completed. In this report, data on years of school completed were derived from the combination of answers to two questions, (a) "What is the highest grade of school that the person has attended?" and (b) "Did the person finish this grade?"

The questions on educational attainment applied only to progress in "regular" schools. Such schools include public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, "regular" schooling is that which advances a person toward an elementary or high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of Data

Estimates in this report were primarily derived from the Current Population Survey. Additional data were obtained from selected Decennial Censuses. The Current Population Survey and the Decennial Censuses are programs conducted by the Bureau of the Census.

Current Population Survey (CPS). The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked every month about each member 14 years old and older in each sample household. In addition, supplementary questions are asked each March about household and family characteristics. Most of the CPS estimates in this report are based on data obtained in March 1978. Some estimates are based on data obtained in March for earlier years. Estimates developed from the supplementary questions and included in this report include persons in the Armed Forces living off post or with their families on post.

The present CPS sample was initially selected from the 1970 census files and is updated continuously to reflect new construction where possible (see section "Nonsampling Variability" below). The monthly CPS sample is spread over 461 areas with coverage in each of the 50 States and the District of Columbia. A supplementary sample of housing units in 24 States and the District of Columbia was incorporated with the monthly CPS sample in March 1977. The expanded CPS sample is located in 614 areas comprising 1,113 counties, independent cities, and divisions in the nation. The 614 sample areas used since March 1977 include 461 areas from the monthly CPS and 153 supplementary areas.

In the expanded sample, approximately 56,000 occupied households were eligible for interview. Of this number, about 2,500 occupied units were visited but interviews were not obtained because the occupants were not found at home after repeated calls or were unavailable for some other reason. In addition to the 56,000, there were also about

9,500 sample units which were visited but were found to be vacant or otherwise not to be interviewed.

Samples for previous sample designs were selected from files from the most recently completed census. The following table provides a description of some aspects of the CPS sample designs in use during the referenced data-collection periods.

The estimation procedure used for the monthly CPS data involves the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from decennial censuses; statistics of births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces. The estimation procedure for the data in the report also involved a further adjustment so that husband and wife of a household received the same weight.

Decennial census of population. Decennial census data in this report are based on complete counts or on the samples associated with the census. The 1960 data shown in this report are from special tabulations developed from the 25-percent sample associated with the 1960 Census of Population and Housing and the 1970 data are from special tabulations developed from the 5-percent sample associated with the 1970 Census of Population and Housing. Descriptions of samples from the census are found in the appropriate census publications.

Reliability of the Estimates

Since the estimates in this report are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaire, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey: sampling and nonsampling. The standard errors provided for this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data. The full extent of nonsampling error is unknown.

Description of the Current Population Survey

Time period	Number of sample areas ¹	Households eligible		Housing units visited, not eligible ²
		Interviewed	Not interviewed	
Supplemental sample.....	153	8,500	500	1,500
Aug. 1972 to present.....	461	45,000	2,000	8,000
Aug. 1971 to July 1972.....	449	45,000	2,000	8,000
Jan. 1967 to July 1971.....	449	48,000	2,000	8,500
Mar. 1963 to Dec. 1966.....	357	33,500	1,500	6,000
Jan. 1960 to Feb. 1963.....	333	33,500	1,500	6,000

¹These areas were chosen to provide coverage in each State and the District of Columbia.

²These are housing units which were visited, but were found to be vacant or otherwise not eligible for interview.

Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

Nonsampling variability. As in any survey work, the results are subject to errors of response and nonreporting in addition to sampling variability. Nonsampling errors can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness to provide correct information on the part of respondents, inability to recall information, errors made in collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units within the sample (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Overall undercoverage, as compared to the level of the decennial census, is about 5 percent. It is known that CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races than for Whites.

Ratio estimation to independent age-sex-race population controls, as described previously, partially corrects for the bias due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics than interviewed persons in the same age-sex-race group. Further, the independent population controls used have not been adjusted for undercoverage in the 1970 census, which was estimated at 2.5 percent of the population with similar undercoverage differentials by age, sex, and race as are observed in CPS.

The approximate magnitude of two sources of undercoverage of housing units is known. Of the 83,000,000 housing units in the U.S. about 600,000 new construction housing units other than mobile homes are not represented in the CPS sample because they were assigned building permits prior to January 1970, but construction was not completed by the time of the census (i.e., April 1970). Conventional new construction for which building permits were issued after 1969, is represented. About 290,000 occupied mobile homes are not represented in CPS; these units were either missed in the census or have been built or occupied since the census. These estimates of missed units are relevant to the present sample only and not to earlier designs where the extent of undercoverage was generally less. The extent of other sources of undercoverage of housing units is unknown but believed to be small.

Sampling variability. The standard errors given in the following tables are primarily measures of sampling variability, that is, of the variation that occurred by chance because a sample rather than the entire population was surveyed. The sample estimate and its estimated standard error enable one to construct confidence intervals, ranges that would include the average results of all possible samples with a known

probability. For example, if all possible samples were selected, each of these surveyed under essentially the same general conditions and using the same sample design, and an estimate and its estimated standard error were calculated from each sample, then:

1. Approximately 68 percent of the intervals from one standard error below the estimate to one standard error above the estimate would include the average result of all possible samples.
2. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimates would include the average result of all possible samples.
3. Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.

The average estimate derived from all possible samples is or is not contained in any particular computed interval. However, for a particular sample, one can say with a specified confidence that the average estimate derived from all possible samples is included in the confidence interval.

All the statements of comparison appearing in the text are significant at a 1.6 standard error level or better, and most are significant at a level of more than 2.0 standard errors. This means that for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by use of the phrase, "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

Note when using small estimates. Summary measures such as medians, rates, and percent distributions are shown in the report only when the base is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories to serve each data users' needs.

Comparability with other data. Caution should be used in comparing CPS estimates from 1977 and 1978, when the expanded sample was used, to those from 1976 and earlier years. Some relatively large differences in estimates of population in metropolitan and nonmetropolitan areas have been observed between the 461 and the 614 area samples. These differences reflect a relatively large increase in variance on those estimates and do not represent actual changes in the population.

Standard errors for data based on the decennial census. Sampling errors of all data from the samples of the 1960 and 1970 Decennial Census shown in this report are small enough to be disregarded.

Standard error tables and their use. In order to derive standard errors that would be applicable to a large number of estimates and could be prepared at a moderate cost, a number of approximations were required. Therefore, instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result, the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error.

The figures presented in tables A-1 through A-4 are approximations to standard errors of various estimates shown in this report. Estimated standard errors for specific characteristics cannot be obtained from tables A-1 through A-4 without the use of the factors in table A-5. These factors must be applied to the generalized standard errors in order to adjust for the combined effect of sample design and estimating procedure on the value of the characteristic. Standard errors for intermediate values not shown in the generalized tables of standard errors may be approximated by interpolation.

Two parameters are used (denoted "a" and "b") to calculate standard errors for each type of characteristic; they are presented in table A-6. These parameters were used to calculate the standard errors in tables A-1 through A-4 and to calculate the factors in table A-5. They also may be used to directly calculate the standard errors for estimated numbers and percentages. Direct computation of the standard errors will give more accurate results than the use of the standard error tables. Methods for direct computation are given in the following sections.

Standard errors of estimated numbers. The approximate standard error, σ_x , of an estimated number shown in this report can be obtained in two ways. It may be obtained by use of the formula

$$\sigma_x = f\sigma \quad (1)$$

where f is the appropriate factor from table A-5, and σ is the standard error on the estimate obtained by interpolation from table A-1 or A-2. Alternatively, standard errors may be approximated by formula (2), from which the standard errors were calculated in tables A-1 and A-2. Use of this formula will provide more accurate results than the use of formula (1) above.

$$\sigma_x = \sqrt{ax^2 + bx} \quad (2)$$

Here x is the size of the estimate and a and b are the parameters in table A-6 associated with the particular type of characteristic.

Standard errors of estimated percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends on both the size of the percentage and the size of the total upon which this

Table A-1. Standard Errors of Estimated Numbers-Total, White or Spanish Origin

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
20.....	8	2,500.....	93
30.....	10	5,000.....	131
50.....	13	10,000.....	182

¹For estimates larger than 10,000,000 multiply the estimate by 0.02 to get the standard error. Use of formula (2) and the parameters in table A-6 will give more accurate results.

Note: For a particular characteristic see table A-5 for the appropriate factor to apply to the above standard errors.

percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameters indicated by the numerator. The approximate standard error, $\sigma_{(x,p)}$, of an estimated percentage can be obtained by use of the formula

$$\sigma_{(x,p)} = f\sigma \quad (3)$$

In this formula f is the appropriate factor from table A-5 and σ is the standard error on the estimate from either table

A-3 or A-4. Alternatively, standard errors may be approximated by formula (4), from which the standard errors in tables A-3 and A-4 were calculated; direct computation will give more accurate results than use of the standard error tables and the factors.

$$\sigma_{(x,p)} = \sqrt{\frac{b}{x} (p) (100-p)} \quad (4)$$

Here x is the size of the subclass of persons or families and unrelated individuals which is the base of the percentage, p is the percentage ($0 < p < 100$), and b is the parameter in table A-6 associated with the particular type of characteristic in the numerator of the percentage.

Estimates of divorced persons per 1,000 married persons with spouse present. The standard error on an estimate of

the number of divorced persons per 1,000 married persons with spouse present cannot be calculated directly from the standard error tables. The estimate involves the ratio of the total persons divorced, x , to the total number of married persons with spouse present, y , multiplied by 1,000. The standard error of this estimate is calculated by the following formula:

$$\sigma_{\left[\frac{x}{y} (1,000)\right]} = (1,000) \sqrt{\left(\frac{x}{y}\right)^2 \left[\frac{\sigma_x^2}{x^2} + \frac{\sigma_y^2}{y^2} \right]} \quad (5)$$

The standard errors of the estimates of the total number of divorced persons, σ_x , and the standard error of the total

Note: For a particular characteristic see table A-5 for the appropriate factor to apply to the above standard errors.

number of married persons with spouse present, σ_y , should both be calculated using table A-1 and factor table A-5 or formula (2).

Illustration of the use of tables of standard errors. Table D of this report shows that there were 1,137,000 unmarried couples in households as of March 1978. Interpolation in table A-1 shows the standard error (σ_x) on an estimate of this size to be approximately 62,000. The factor in table A-5 for total or White — families, households, primary and unrelated individuals is 0.6, thus the standard error is approximately $37,000 \div 62,000 \times 0.6$. The 68-percent confidence interval as shown by the data is from 1,100,000 to 1,174,000. Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. Similarly, we could conclude with 95-percent confidence that the average estimate derived from all possible samples lies within the interval from 1,063,000 to 1,211,000, i.e., $1,137,000 \pm 2 \times 37,000$. As an alternative, using formula (2) and the parameters $a = -.000010$ and $b = 1389$ from table A-6 gives an estimate of the standard error to be 40,000.

Table D also shows that of these 1,137,000 unmarried couples, 272,000, or 23.9 percent, had children present in the household. Table A-6 shows the b parameter for total or White — families, households, primary and unrelated individuals to be 1389; using formula (4) the standard error on an estimate of 23.9 percent is

$$\sqrt{\frac{1389}{1,137,000}} (23.9) (100-23.9) \doteq 1.5 \text{ percent}$$

Consequently, the 68-percent confidence interval is from 22.4 to 25.4 percent. Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. Similarly, we could conclude with 95-percent confidence that the average estimate derived from all possible samples lies within the interval from 20.9 to 26.9 percent, i.e., $23.9 \pm (2 \times 1.5)$ percent. As an alternative, tables A-3 and A-5 can be used to compute an estimated standard error of $2.5 \times 0.6 = 1.5$ percent on the estimate of 23.9 percent.

Standard error of a difference. For a difference between two sample estimates, the standard error is approximately equal to

$$\sigma_{(x-y)} = \sqrt{\frac{\sigma_x^2}{x} + \frac{\sigma_y^2}{y}} \quad (6)$$

where σ_x and σ_y are the standard errors of the estimates x and y; the estimates can be of numbers, percents, ratios, etc. This will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will overestimate the true standard error.

Table A-5. Factors to be Applied to Tables A-1 through A-4 to Estimate Standard Errors of Marital Status, Household and Family Characteristics

¹To estimate standard errors for the period 1956 to 1966, multiply the above factors by 1.2.

²Apply these factors to table A-1 or table A-3.

Illustration of the computation of the standard error of a difference between estimated percentages. Table D of the report shows that in 1978, 76.1 percent of all unmarried couples (1,137,000) had no children present in the household. In 1970, 62.5 percent of all unmarried couples (523,000) had no children present. Thus, the apparent difference in percents of all unmarried couples with no children present between 1978 and 1970 is 13.6 percent. Using formula (6), the standard error of the estimated difference of 13.6 percent is about

$$\sqrt{(1.5)^2 + (2.5)^2} = 2.9 \text{ percent}$$

This means the 68-percent confidence interval around the difference is from 10.7 to 16.5 percent. Therefore, a conclusion that the average difference derived from all possible samples lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. Similarly, we could conclude with 95-percent confidence that the average difference derived from all possible samples lies within the interval from 7.8 to 19.4 percent, i.e., $13.6 \pm (2 \times 2.9)$ percent. Since this interval does not include zero, we can conclude with 95-percent confidence that the percentage with no children present was greater in 1978 than in 1970.
