Marital Status and Living Arrangements: March 1979

INTRODUCTION

This report is the latest in an annual series that monitors changes in American marriage and family life. It presents data from the March 1979 Current Population Survey on selected social and demographic characteristics of persons in relation to their marital status and living arrangements. Comparative analyses of these current data with figures from previous years are featured in the text of this report.

The text highlights trends which reflect *increases* in—

- the postponement of marriage
- the proportion of young adults remaining single
- divorced adults
- adults living alone
- unmarried couples
- families maintained by adults with no spouse present
- children living with only one parent

AGE AT FIRST MARRIAGE

The typical age at first marriage for men and women continues to rise as young adults postpone marriage until they are well into their twenties (table A). In the early 1900's, the median age at marriage was relatively high (21 to 22 years for women, and 25 to 26 years for men), but gradually declined to a low point of 20.1 for women and

22.5 for men in 1956. Since that time, it has been rising. In 1979, the estimates were 22.1 years for women and 24.4 years for men, as today's adults are more frequently opting for an extended period of singleness before entering into their first marriage.

The extent to which young adults are delaying entry into first marriage is also readily apparent when viewing the increase in the percent of persons never married at the time of the survey (table B). The percent of all women 14 years and over who had never married increased from 19 percent in 1960 to 24 percent in 1979. Moreover, the proportion of never-married women 20 to 24 years old in 1979 was three-fourths again as large as that for women in their early twenties in 1960. In 1979, one-half (49 percent) of all women 20 to 24 years old were single as compared with only 29 percent in 1960. Women aged 25 to 29 also showed a marked increase in the proportion never married (from 10 percent in 1960 to 20 percent in 1979). The data indicate that all but 4 percent of the women 45 to 54 years old in 1979 had married, but whether more than 90 percent of the women who are now in their twenties will marry by the time they reach their fifties remains to be seen.

DIVORCE RATIO

A second major marital status trend along with the notable increase in nonmarriage among young adults has been the

overall rise in marital dissolution through divorce. This rate of change can be monitored by observing over time the ratio of the number of divorced persons per 1,000 persons married and living with their spouse (table C). Between March 1970 and March 1979, the ratio of all divorced persons per 1,000 husbands and wives in intact marriages had risen by 96 percent, from 47 per 1,000 to 92 per 1,000. The increase for Black persons was from 83 per 1,000 to 197 per 1,000 during the same time span. The corresponding ratios for Whites were considerably lower, 44 per 1,000 in 1970 versus 84 per 1,000 in 1979. The fact that more men than women remarry after divorce helps to account for the relatively high divorce ratio for women—111 divorced women per 1,000 wives as compared with 72 divorced men per 1,000 husbands. Among the age, sex, and race groups shown in table C, Black women had the highest ratio of divorced persons to married persons living with a spouse (243 per 1,000 in 1979). Persons between 30 and 44 years old had a higher divorced ratio in 1979 than any other age group.

Although not reflected in table C, there appears to have been no dramatic change in the divorce ratios over the last year or two. Additionally, data compiled by the National Center for Health Statistics indicate that for 1976, 1977, and 1978, the divorced level changed very little. (The provisional estimate for 1978 was 5.2 per 1,000 population, as compared with 5.0 in 1977 and 1976.) However, comparisons on a year-to-year basis for only a few years do not provide enough evidence to predict with confidence that a lasting deceleration of the divorce upswing has begun.

LIVING ARRANGEMENTS

Most people live in family groups (145 million persons, or 89 percent of the noninstitutional population), but a sizable proportion do not live with any relatives (9 percent in their own households and 2 percent in the quarters of others). Moreover, most of the families are married-couple families. Eighty-three percent of all families were maintained by a married couple, 15 percent were maintained by a woman with no husband present, and 3 percent were maintained by a man with no wife present.

There is an obvious association between trends in living arrangements of the population and trends in marital status. A high incidence of divorce and separation leads to family fragmentation, and a postponement of marriage may lead to increases in non-family situations. This section presents information on recent major trends in living arrangements. Developments are highlighted against a perspective of changing marital patterns.

Living alone. In 1979, more than 1 of every 5 households in the United States consisted of a person who lived alone. The number of these one-person households grew by nearly 60 percent over a 9 year period, from 10.9 million in 1970 to 17.2 million in 1979 (table D). In contrast, the total number of households grew by 22 percent during the same period. Reasons for the relatively high rate of increase in people living alone include: the increasing numbers of elderly persons (especially widows) who are able to continue to

1960.....	42	38	78	28	41	53	44

maintain their own homes, the increasing incidence of marital dissolution through divorce and separation, and the postponement of first marriage among young adults, accompanied by the tendency for these young single people to establish households apart from their parents for a period of independent nonfamily living. Women comprised almost two-thirds of the one-person households in 1979, but the number of men living alone increased at a faster rate than that for women since 1970—83 percent for men as compared with 47 percent for women. Overall, the largest increases in one-person households during the 1970's occurred among divorced and never-married persons. Moreover, the number of men and women under 35 years old living alone increased the most, by 200 percent, with smaller increases occurring among those in the older ages.

Unmarried couples. In 1979, there were 1.3 million households shared by two unrelated adults of the opposite sex (referred to here as "unmarried-couple" households), representing more than twice the one-half million (523,000) recorded in 1970. Three-fourths of these households in 1979 consisted of two adults only, and the remaining one-fourth consisted of two adults and one or more children under 14 years old (table E).

Data on the marital status of unrelated men cross-classified by the marital status of the unrelated women with whom they were sharing living quarters are shown in table F. In 1979, about one-half of the men and one-half of the women living in unmarried-couple households had never been married, 28 percent of the women and 32 percent of the men were divorced, 11 percent of the women and 5 percent of the men were widowed, 7 percent of the women and 10 percent

of the men were separated, and the remaining 2 percent of either sex were married but not living with their spouse.

A comparison of the marital status of each partner shows that the most frequent combinations were a never-married man living with a never-married woman (36 percent) and a divorced man living with a divorced woman (15 percent).

Despite the spectacular nature of the recent increase in this unmarried-couple living arrangement, the 2.7 million "partners" in these 1.3 million households represent a very small portion of all persons in "couple" situations. In 1979, there were an estimated 96.5 million men and women who were married and living with a spouse. Thus, the partners in unmarried couples represented only about 3 percent of all persons among couples living together in 1979.

Families of persons living apart from a spouse. Families not maintained by a married couple increased by 50 percent in the 1970-79 period (table G). Those maintained by a man with no wife present increased by one-third and those maintained by a woman with no husband present increased by one-half since 1970. More than 8 of every 10 of these "other" families in 1979 were maintained by women. The rising incidence of divorce appears to be a major factor in the growth of this family type, as the number of divorced women maintaining families and the number of divorced men maintaining families doubled between 1970 and 1979. Since the definition for family in this report requires only that the two persons living together be related by birth, marriage, or adoption, not all of the 10.1 million other families have children under 18 present in the home. In 1979, only 34 percent of the families maintained by men and 63 percent of the families maintained by women represented single-parent family situations.

- Represents zero. X Means not applicable.

Living arrangements of children under 18. Because of the falling birth rate, the number of children under 18 years old declined during the 1970's (from 69.2 million in 1970 to 62.4 million in 1979). Table H shows that despite a 10-percent decline in the youth population, there was actually a 40-percent increase in the number of children living with only one parent. In 1979, close to 19 percent of all children under 18 lived with only one parent as compared with 12 percent in 1970. Most children in one-parent families lived with their mother and more than one-half of them lived with a mother who was either divorced or separated. Additionally, the table shows that while only 15 percent of all children under 18 were Black, fully 36 percent of all children living in one-parent situations were Black. Among Blacks, the number of children living with one parent was virtually the same as the number living with two parents.

RELATED REPORTS

Data for 1979, together with historical data back to 1947, on households and families by type were published in Series P-20, No. 345. Projections of the number of households and families for the United States from 1979 to 1995 were presented in Series P-25, No. 805. Information on married couples was recently published in Series P-23, No. 77, *Perspectives on American Husbands and Wives*. Data on families maintained by women with no husband present were reported in Series P-23, No. 50, *Female Family Heads*.

Results of a study on marital history of men and women are provided in Series P-20, No. 297, *Number, Timing, and Duration of Marriages and Divorces in the United States: June 1975* and Series P-20, No. 312, *Marriage, Divorce, Widowhood, and Remarriage by Family Characteristics: June 1975*.

Figures for 1978 on marital status and family status were issued in Series P-20, Nos. 338 and 340. Additional statistics for years since 1947 on subjects covered in this report have been published by the Bureau of the Census in other reports in Series P-20. See the list of reports shown on pages 64, 65, and 66.

Statistics on marital status for 1970 for standard metropolitan statistical areas, counties, urbanized areas, cities, States, regions, and the United States are presented in 1970 Census of Population, Volume I, *Characteristics of the Population*, chapter B, "General Population Characteristics." Detailed statistics on marital status and presence of spouse by age for 1970 for States and for large counties and standard metropolitan statistical areas are presented in Volume I, Chapter D, "Detailed Characteristics." Similar data for the United States and regions, for 1960, were published in 1960 Census of Population, Volume I, *Characteristics of the Population, United States Summary*.

The 1970 census report Series PC(2)-4B, *Persons by Family Characteristics*, presents statistics on the marital and family status of persons 14 years old and over, by age, race, and sex, for the United States as a whole and for urbanized areas, and on persons under 18 years old by presence and marital status of parents, for the United States by type of residence, and for regions. In addition, this report shows all family members by age, sex, and family relationship by characteristics of the families of which they are members, including size of family, number of children, and education, occupation, and income of the family head.

The 1970 census report Series PC(2)-4C, *Marital Status*, shows detailed statistics on the marital status distribution of the population 14 years old and over by selected social and economic characteristics for the United States. Series PC(2)-4D, *Age at First Marriage*, contains detailed statistics for the United States on characteristics of persons 14 years old and over by age at first marriage, based on answers to questions on date of first marriage. In addition, the report shows average annual rates of first marriage per 1,000 single persons 14 to 79 years old in 1968 and 1969 for States. Statistics for 1970 on women by marital status, number of children ever born, and age at first marriage, are presented for the United States in Series PC(2)-3A, *Women by Number of Children Ever Born*.

NOTE

In the past the Census Bureau has designated a head of household to serve as the central reference person for the collection and tabulation of data for each member of the household (or family). However, the trend toward recognition of equal status and roles for adult family members makes the term "head" less relevant in the analysis of household and family data. As a result, the Bureau is currently developing new techniques for the enumeration and presentation of data which will eliminate the concept "head." Although the data in this report are based on this concept, methodology for future Census Bureau reports will reflect a gradual movement away from this traditional practice.

Appendix A. Definitions and Explanations

Coverage. The population in this report includes the civilian noninstitutional population of the United States plus approximately 824,000 members of the Armed Forces in the United States living off post or with their families on post in 1979, but excludes all other members of the Armed Forces. However, the data in table A on median age at first marriage for men refer to the total male population which includes, in addition to the above, the male members of the Armed Forces overseas and in military barracks and similar quarters in the United States.

Symbols. A dash (—) represents zero or rounds to zero. The symbol "B" means that the base for the derived figure is less than 75,000. An "X" means not applicable, and "NA" means not available.

Rounding of estimates. Individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

Farm-nonfarm residence. The farm population refers to rural residents living on farms. The method of determining farm-nonfarm residence in the present survey and in the Current Population Surveys (CPS) since March 1960 is the same as that used in the 1960 and 1970 censuses but differs from that used in earlier surveys and censuses. Since March 1960 in the CPS, farm residence has been determined by the responses to two questions. Owners are asked "Does this place have 10 or more acres?" and renters are asked "Does the place you rent have 10 or more acres?" If the response is "Yes," the respondent is asked "During the past 12 months, did sales of crops, livestock, and other farm products from this place amount to \$50 or more?" If the acreage response is "No," the inquiry relates to sales of \$250 or more. Rural persons in motels and tourist camps, and those living on rented places where no land is used for farming, are not classified as farm population. The nonfarm population, as the term is used here, comprises persons living in urban areas and rural persons not on farms.

Although the method of determining farm-nonfarm residence has not changed since March 1960, the underlying sampling methods and estimation procedures have changed. For a discussion of changes see *Employment and Earnings*, Volume 18, No. 8, February 1972, pp. 6-9, published by the Bureau of Labor Statistics.

Metropolitan-nonmetropolitan residence. The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central county. In New England, SMSA's consist of towns and cities, rather than counties. The metropolitan population in this report is based on SMSA's as defined in the 1970 census and does not include any subsequent additions or changes.

Central cities. Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities. If only one central city is designated, then it must have 50,000 inhabitants or more. The area title may include, in addition to the largest city, up to two city names on the basis and in the order of the following criteria: (1) The additional city has at least 250,000 inhabitants or (2) the additional city has a population of one-third or more of that of the largest city and a minimum population of 25,000. An exception occurs where two cities have contiguous boundaries and constitute, for economic and social purposes, a single community of at least 50,000, the smaller of which must have a population of at least 15,000.

Age. The age classification is based on the age of the person at the person's last birthday.

Race. The population is divided into three groups on the basis of race: White, Black, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except White and Black.

Persons of Spanish origin. Persons of Spanish origin in this report were determined on the basis of a question that asked for self-identification of the person's origin or descent. Respondents were asked to select their origin (or the origin of some other household member) from a "flash card" listing ethnic origins. Persons of Spanish origin, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Cuban, Central or South American, or some other Spanish origin. Persons of Spanish origin may be of any race.

Marital status. The marital status classification identifies four major categories: single (never married), married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category "married" is further divided into "married, spouse present," "separated," and "other married, spouse absent." A person was classified as "married, spouse present" if the husband or wife was reported as a member of the household, even though he or she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as separated included those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily separated because of marital discord. The group "other married, spouse absent" includes married persons living apart because either the husband or wife was employed and living at a considerable distance from home, was serving away from home in the Armed Forces, had moved to another area, or had a different place of residence for any other reason except separation as defined above.

Husband in Armed Forces. When a woman was reported as married but her husband was not enumerated as a member of the same household, an additional question was asked to determine whether her husband was in the Armed Forces. Women who were reported as separated were not asked the additional question.

Age at first marriage. The median age at first marriage, as shown in this report, is an approximation derived indirectly from tabulations of marital status and age. In computing this median, several steps are involved. First, the expected proportion of young people who will ever marry during their lifetime is computed. Second, one-half this expected proportion is calculated. Third, the current age of young people who are at this halfway mark is computed. From the assumptions made and the procedures used, it follows that the date of the survey is also the date when this halfway mark is reached. One-half of the young people of the given age who it is assumed will ever get married had done so prior to the survey date and one-half are expected to marry in years to come.

In estimating the proportion of young people who will eventually marry, errors of 3 or 4 percentage points would affect the final estimate of the median age at first marriage by only 0.1 or 0.2 of a year. For convenience, the proportion ever married among persons 45 to 54 years old was used. Other age combinations could have been used with little change in the results, so long as they included very few persons who would subsequently marry for the first time.

When the figures on median age at first marriage for different years are compared, caution should be exercised in the interpretation of small changes. Because of sampling variability of the survey data and the limitations of the estimating technique itself, the errors in the estimates of the median age may be slightly larger than annual changes of one- or two-tenths of a year of age. Moreover, there is

evidence that computation of the median age at first marriage for men in some years is affected by changes in the distribution by single years of age within the age groups when most first marriages take place; changes of up to one-half year in the median for men may reflect this factor rather than any real change taking place in the ages of men at first marriage.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment, or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupant(s).

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Family. The term "family," as used here, refers to a group of two persons or more related by birth, marriage, or adoption and residing together; all such persons are considered as members of one family. A lodger and his/her spouse who are not related to the person or persons who maintain the household, or a resident employee and his/her spouse living in, are considered as a separate family. Thus, a household may contain more than one family. However, if the son of the person or couple who maintains the household and the son's wife are members of the household, they are treated as part of the parent's family. A person maintaining a household alone, or with unrelated persons only, is regarded as a household but not as a family. Thus, some households do not contain a family.

Primary family. A primary family is a family that includes among its members the person or couple who maintains the household. In the text of this report the term "family households" is used in discussing the households of primary families—a term used in the detailed tables.

Secondary family. A secondary family is a family that does not include among its members the person or couple who maintains the household, or any persons related to the person or couple who maintains the household. Members of secondary families may include persons such as guests, lodgers, or resident employees and their relatives living in a household.

Persons living with relatives in group quarters were formerly considered as members of secondary families. However, the number of such families became so small (37,000 in 1967) that beginning with data for 1968 (and beginning with census data for 1960) the Bureau of the Census includes persons in these families in the count of secondary individuals.

Subfamily. A subfamily is a married couple with or without children, or one parent with one or more own single (never married) children under 18 years old, living in a household and related to, but not including, the person or couple who maintains the household. The most common example of a subfamily is a young married couple sharing the home of the husband's or wife's parents. Members of a subfamily are also members of a primary family. The number of subfamilies, therefore, is not included in the number of families.

Married couple. A married couple, as defined for census purposes, is a husband and wife enumerated as members of the same household. The married couple may or may not have children living with them. The expression "husband-wife" or "married-couple" before the term "household," "family," or "subfamily" indicates that the household, family, or subfamily is maintained by a husband and wife. Detailed tables which display data for characteristics of the head (e.g., age, sex, race) for households or families show characteristics of the husband in husband-wife households or families.

Unmarried couple. An unmarried couple is composed of two unrelated adults of the opposite sex (one of whom is the householder) who share a housing unit with or without the presence of children under 14 years old.

Unrelated individuals. Unrelated individuals are persons (other than inmates of institutions) who are not living with any relatives. An unrelated individual may be (1) a person living alone or with nonrelatives only, (2) a lodger or resident employee with no relatives in the household, or (3) a group quarters member who has no relatives living with him/her. Thus, a widow who occupies her house alone or with one or more other persons not related to her, a roomer not related to anyone else in the housing unit, a maid living as a member of her employer's household but with no relatives in the household, and a resident staff member in a hospital living apart from any relatives are all examples of unrelated individuals.

Primary individual. A primary individual is a person maintaining a household while living alone or with nonrelatives only. In the text of this report the term "nonfamily households" is used in discussing the households of primary individuals—a term used in the detailed tables.

Secondary individual. A secondary individual is a person in a household or group quarters such as a guest, lodger, or resident employee (excluding primary individuals and inmates of institutions) who is not related to any other person in the household or group quarters. (See section above on "Secondary family" for slight change in coverage of secondary individuals in 1968.)

Own children and related children. "Own" children in a family are sons and daughters, including stepchildren and adopted children, of the householder. Similarly, "own" children in a subfamily are sons and daughters of the married couple or parent in the subfamily. "Related" children in a family include own children and all other children in the household who are related to the householder by birth, marriage, or adoption. All children shown as members of subfamilies are own children. For each type of family unit identified in the CPS, the count of own children under 18 years old is limited to single (never married) children; however, "own children under 25" and "own children of any age," as the terms are used here, include all children regardless of marital status.

The count of related children in families was formerly restricted to single (never married) children. However, beginning with data for 1968 the Bureau of the Census includes ever-married children under the category of related children. This change added approximately 20,000 children to the category of related children in March 1968.

Group quarters. Group quarters are now defined in the Current Population Survey as noninstitutional living arrangements for groups not living in conventional housing units or groups living in housing units containing five or more persons unrelated to the person in charge. Inmates of institutions (starting in 1972) are not included in the Current Population Survey.

Appendix B. Source and Reliability of the Estimates

SOURCE OF DATA

Estimates in this report were primarily derived from the Current Population Survey. Additional data were obtained from selected Decennial Censuses. The Current Population Survey and the Decennial Censuses are programs conducted by the Bureau of the Census.

Current Population Survey (CPS). The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked every month about each member 14 years old and older in each sample household. In addition, supplementary questions are asked each March about household and family characteristics. Most of the CPS estimates in this report are based on data obtained in March 1979. Some estimates are based on data obtained in March for earlier years. Estimates developed from the supplementary questions and included in this report include persons in the Armed Forces living off post or with their families on post.

The present CPS sample was initially selected from the 1970 census file and is updated continuously to reflect new constructions where possible (see section, "Nonsampling Variability," below). The monthly CPS sample is spread over 461 areas with coverage in each of the 50 States and the District of Columbia. A supplementary sample of housing units in 24 States and the District of Columbia was incorporated with the monthly CPS sample to produce the March 1977 supplement data and has been permanently included with the monthly sample since January 1978 to produce all the data. The expanded CPS sample is located in 614 areas comprising 1,113 counties, independent cities, and divisions in the nation. The 614 sample areas include 461 sample areas from the monthly CPS and 153 supplementary areas.

Samples for previous sample designs were selected from files from the most recently completed census. The following table provides a description of some aspects of the CPS sample designs in use during the referenced data collection periods.

The estimation procedure used for the monthly CPS data involves the inflation of weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates are based on statistics from decennial censuses; statistics on births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces. For the March supplement data, persons in the Armed Forces living off post or with their families on post are also included and the estimation procedure involves a further adjustment so that husband and wife of a household receive the same weight.

Decennial Census of Population. Decennial census data in this report are based on complete counts or on the samples associated with the census. The 1960 data shown in this report are from special tabulations developed from the 25-percent sample associated with the 1960 Census of Population and Housing and the 1970 data are from special tabulations developed from the 5-percent sample associated with the 1970 Census of Population and Housing. Descriptions of samples from the census are found in the appropriate census publications.

RELIABILITY OF THE ESTIMATES

Since the CPS estimates were based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same

Description of the Current Population Survey

Time period	Number of sample areas ¹	Households eligible		Housing units visited, not eligible ²
		Interviewed	Not interviewed	
Supplemental sample.....	153	8,500	500	1,500
August 1972 to present.....	461	45,000	2,000	8,000
August 1971 to July 1972.....	449	45,000	2,000	8,000
January 1967 to July 1971.....	449	48,000	2,000	8,500

¹These areas were chosen to provide coverage in each State and the District of Columbia with the exception of the supplemental sample.

²These are housing units which were visited but were found to be vacant or otherwise not eligible for interview.

questionnaires, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey—sampling and nonsampling. The standard errors provided for this report primarily indicate the magnitude of the sampling errors. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data. The full extent of the nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

Nonsampling variability. Nonsampling errors can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness to provide correct information on the part of respondents, inability to recall information, errors made in collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Overall undercoverage, as compared to the level of the decennial census, is about 5 percent. It is known that CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races than for Whites. Ratio estimation to independent age-sex-race population controls, as described previously, partially corrects for the bias due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics than interviewed persons in the same age-sex-race group. Further, the independent population controls used have not been adjusted for undercoverage in the 1970 census, which was estimated at 2.5 percent of the population, with similar undercoverage differentials by age, sex, and race as in CPS.

Sampling variability. The standard errors given in the following tables are primarily measures of sampling variability, that is, of the variations that occurred by chance because a sample rather than the entire population was surveyed. The sample estimate and its estimated error enable one to construct confidence intervals, ranges that would include the average result of all possible samples with a known probability. For example, if all possible samples were selected, each of these surveyed under essentially the same general conditions and using the same sample design, and an estimate and its estimated standard error were calculated from each sample, then:

1. Approximately 68 percent of the intervals from one standard error below the estimate to one standard error above the estimate would include the average result of all possible samples.

2. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.
3. Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.

The average estimate derived from all possible samples is or is not contained in any particular computed interval. However, for a particular sample, one can say with a specified confidence that the average estimate derived from all possible samples is included in the confidence interval.

All the statements of comparison appearing in the text are significant at a 1.6 standard error level or better, and most are significant at a level of more than 2.0 standard errors. This means that for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by use of the phrase, "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

Note when using small estimates. Summary measures such as medians, rates, and percent distributions are shown in the report only when the base is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories to serve each data users' needs.

Comparability with other data. Data obtained from the CPS and other governmental sources are not entirely comparable. This is due in large part to differences in interviewer training and experience and in differing survey processes. This is an additional component of error not reflected in the standard error tables. Therefore, caution should be used in comparing results between these different sources.

Caution should also be used in comparing CPS estimates from January 1978 and later months, when the expanded sample was used, to those prior to January 1978.¹ Some relatively large differences in estimates of population in metropolitan and nonmetropolitan areas have been observed between the 461 and 614 area samples. These differences also have a relatively large variance and thus do not provide reliable measures of actual changes in the population.

Changes in CPS design and procedures over the last several years have made the annual series of sample population data for metropolitan and nonmetropolitan areas inconsistent. Analytic comparisons of year-to-year changes in these figures

¹ Estimates from the March 1977 Supplement were also obtained using the expanded sample. Hence, caution should be used when comparing March 1977 Supplement estimates with those not based on the expanded sample.

should be avoided. Trends in metropolitan and non-metropolitan population growth over the 1970-79 and 1976-79 periods should not be appreciably affected by the procedural changes.

The major revisions to the CPS sample design and estimation methods have involved the expansion of the number of sample units from 55,000 housing units to 65,500 housing units. This incorporation of approximately 10,000 supplemental housing units into the March CPS sample in 1977 was accompanied by new procedures for inflating the sample results to reflect national estimates. It was determined subsequent to the introduction of the additional sample that the new inflating (weighting) procedures used for processing both the March 1977 and March 1978 CPS supplement data had resulted in an apparent overestimate of the nonmetropolitan population and corresponding underestimate of the metropolitan population for those years. For March 1979, another revision of the weighting process was introduced to correct the problem discovered in the earlier procedures. The result of this change was a large spurious increase in the metropolitan population and decrease in the nonmetropolitan population relative to March 1978 levels.

The March 1979 CPS metropolitan-nonmetropolitan population estimates also reflect other operational changes including the introduction of a coverage improvement sample designed to provide greater accuracy in survey estimation.

The net effect of all changes in procedure was to increase the metropolitan area estimates. Research and detailed analysis of the impact of each procedural change on the population estimates is underway and the results will be issued in a forthcoming technical report.

Standard errors for data based on the decennial census. Sampling errors of all data from the samples of the 1960 and 1970 Decennial Census shown in this report are small enough to be disregarded.

Standard error tables and their use. In order to derive standard errors that would be applicable to a large number of estimates and could be prepared at a moderate cost, a number of approximations were required. Therefore, instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result, the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error.

The figures presented in tables B-1 through B-4 are approximations to standard errors of various estimates shown in this report. Estimated standard errors for specific characteristics cannot be obtained from tables B-1 through B-4 without the use of the factors in table B-5. These factors must be applied to the generalized standard errors in order

Table B-1. Standard Errors of Estimated Numbers—Total, White, or Spanish Origin

(68 chances out of 100. Numbers in thousands.)

Size of estimate	Standard error	Size of estimate	Standard error
20.....	8	2,500.....	93
30.....	10	5,000.....	131
50.....	13	10,000.....	182
100.....	19	25,000.....	277
250.....	30	50,000.....	364
500.....	42	100,000 ¹	424
1,000.....	59		

¹For estimates larger than 100 million, multiply the estimate by 0.004 to get the standard error. Use of formula (2) and the parameters in table B-6 will give more accurate results.

Note: For a particular characteristic see table B-5 for the appropriate factor to apply to the above standard errors.

Table B-2. Standard Errors of Estimated Numbers—Black and Other Races

(68 chances out of 100. Numbers in thousands.)

Size of estimate	Standard error	Size of estimate	Standard error
20.....	10	500.....	50
30.....	12	1,000.....	69
50.....	16	2,500.....	106
100.....	22	5,000.....	141
250.....	35	10,000 ¹	171

¹For estimates larger than 10 million, multiply the estimate by 0.017 to get the standard error. Use of formula (2) and the parameters in table B-6 will give more accurate results.

Note: For a particular characteristic see table B-5 for the appropriate factor to apply to the above standard errors.

to adjust for the combined effect of sample design and estimating procedure on the value of the characteristic. Standard errors for intermediate values not shown in the generalized tables of standard errors may be approximated by interpolation.

Two parameters are used (denoted "a" and "b") to calculate standard errors for each type of characteristic; they are presented in table B-6. These parameters were used to calculate the standard errors in tables B-1 through B-4 and to calculate the factors in table B-5. They also may be used to directly calculate the standard errors for estimated numbers and percentages. Direct computation of the standard errors will give more accurate results than the use of the standard error tables. Methods for direct computation are given in the following sections.

Standard errors of estimated numbers. The approximate standard error, σ_x , of an estimated number shown in this report can be obtained in two ways. It may be obtained by use of the formula

$$\sigma_x = f\sigma \quad (1)$$

where f is the appropriate factor from table B-5, and σ is the standard error on the estimate obtained by interpolation from table B-1 or B-2. Alternatively, standard errors may be approximated by formula (2), from which the standard errors were calculated in tables B-1 and B-2. Use of this formula will provide more accurate results than the use of formula (1) above.

$$\sigma_x = \sqrt{ax^2 + bx} \quad (2)$$

Here x is the size of the estimate and a and b are the parameters in table B-6 associated with the particular type of characteristic.

Standard errors of estimated percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends on both the size of the percentage and the size of the total upon which this percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameters indicated by the numerator. The approximate standard error, $\sigma_{(x,p)}$, of an estimated percentage can be obtained by use of the formula

$$\sigma_{(x,p)} = f\sigma \quad (3)$$

In this formula f is the appropriate factor from table B-5 and σ is the standard error on the estimate from either table B-3 or B-4. Alternatively, standard errors may be approximated by formula (4), from which the standard errors in tables B-3 and B-4 were calculated; direct computation will give more accurate results than use of the standard error tables and the factors.

$$\sigma_{(x,p)} = \sqrt{\frac{b}{x} (p) (100-p)} \quad (4)$$

Here x is the size of the subclass of persons or families and unrelated individuals which is the base of the percentage, p is the percentage ($0 \leq p \leq 100$), and b is the parameter in table B-6 associated with the particular type of characteristic in the numerator of the percentage.

Estimates of divorced persons per 1,000 married persons with spouse present. The standard error on an estimate of the number of divorced persons per 1,000 married persons with spouse present cannot be calculated directly from the standard error tables. The estimate involves the ratio of the total persons divorced, x , to the total number of married persons with spouse present, y , multiplied by 1,000. The standard error of this estimate is calculated by the following formula:

$$\sigma \left[\frac{x}{y} (1,000) \right] = (1,000) \sqrt{\left(\frac{x}{y} \right)^2 \left(\frac{\sigma_x^2}{x^2} + \frac{\sigma_y^2}{y^2} \right)} \quad (5)$$

The standard errors of the estimates of the total number of divorced persons, σ_x , and the standard error of the total number of married persons with spouse present, σ_y , should both be calculated using table B-1 or B-2 and factor table B-5 or formula (2).

Illustration of the use of standard error tables. Table E of this report shows that there were 1,346,000 unmarried-couple households as of March 1979. Interpolation in table B-1 shows the standard error (σ_x) on an estimate of this size to be approximately 67,000. The factor in table B-5 for total or White-families, households, primary and unrelated individuals is 0.6, thus the standard error is approximately $40,000 \doteq 67,000 \times 0.6$. The 68-percent confidence interval as shown by the data is from 1,306,000 to 1,386,000. Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. Similarly, we could conclude with 95-percent confidence that the average estimate derived from all possible samples lies within the interval from 1,266,000 to 1,426,000, i.e., $1,346,000 \pm (2 \times 40,000)$. As an alternative, using formula (2) and the parameters $a = -0.000010$ and $b = 1,389$ from table B-6 gives an estimate of the standard error to be 43,000.

Table E also shows that of these 1,346,000 unmarried-couple households, 197,000 or 14.6 percent were shared by two divorced adults of the opposite sex. Table B-6 shows the b parameter for total or White-families, households, primary and unrelated individuals to be 1,389; using formula (4), the standard error on an estimate of 14.6 percent is

$$\sqrt{\frac{1,389}{1,346,000} (14.6) (100-14.6)} \doteq 1.1 \text{ percent}$$

Consequently, the 68-percent confidence interval is from 13.5 to 15.7 percent. Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. Similarly, we could conclude with 95-percent confidence that the average estimate derived from all possible samples lies within the interval from 12.4 to 16.8 percent, i.e., $14.6 \pm (2 \times 1.1)$ percent. As an alternative, tables B-3 and B-5 can be used to compute an estimated standard error of $1.9 \times 0.6 = 1.1$ percent on the estimate of 14.6 percent.

Standard error of a difference. For a difference between two sample estimates, the standard error is approximately equal to

$$\sigma_{(x-y)} = \sqrt{\sigma_x^2 + \sigma_y^2} \quad (6)$$

where σ_x and σ_y are the standard errors of the estimates x and y ; the estimates can be of numbers, percents, ratios, etc. This will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will overestimate the true standard error.

Illustration of the computation of the standard error of a difference between estimated percentages. Table E of the report shows that in 1979, 2.9 percent of all unmarried-couple households (1,346,000) were shared by two widowed adults of the opposite sex. The apparent difference in percent between the unmarried-couple households shared by divorced adults and widowed adults is 11.7 percent. Using

200,000.....	0.04	0.06	0.09	0.13	0.15	0.2	0.2

Note: For a particular characteristic see table B-5 for the appropriate factor to apply to the above standard errors.

Table B-4. Standard Errors of Estimated Percentages—Black and Other Races

(68 chances out of 100)

Base of estimated percentage (thousands)	Estimated percentage						
	1 or 99	2 or 98	5 or 95	10 or 90	15 or 85	25 or 75	50
100.....	2.2	3.1	4.9	6.7	8.0	9.7	11.2
250.....	1.4	2.0	3.1	4.3	5.1	6.1	7.1
500.....	1.0	1.4	2.2	3.0	3.6	4.3	5.0
1,000.....	0.7	1.0	1.5	2.1	2.5	3.1	3.5
2,500.....	0.4	0.6	1.0	1.3	1.6	1.9	2.2
5,000.....	0.3	0.4	0.7	1.0	1.1	1.4	1.6
10,000.....	0.2	0.3	0.5	0.7	0.8	1.0	1.1
25,000.....	0.14	0.2	0.3	0.4	0.5	0.6	0.7

Note: For a particular characteristic see table B-5 for the appropriate factor to apply to the above standard errors.

formula (6), the standard error of the estimated difference of 11.7 percent is about

$$\sqrt{(1.1)^2 + (0.5)^2} \doteq 1.2$$

This means the 68-percent confidence interval around the difference is from 10.5 to 12.9 percent. Therefore, a conclusion that the average difference derived from all possible samples lies within a range computed in this way would be

correct for roughly 68 percent of all possible samples. Similarly, we could conclude with 95-percent confidence that the average difference derived from all possible samples lies within the interval from 9.3 to 14.1 percent, i.e., $11.7 \pm (2 \times 1.2)$ percent. Since this interval does not include zero, we can conclude with 95-percent confidence that the percentage of unmarried-couple households shared by two divorced adults of the opposite sex was greater than the percentage of unmarried-couple households shared by two widowed adults of the opposite sex.

Table B-5. Factors to be Applied to Tables B-1 through B-4 to Estimate Standard Errors of Marital Status, Household and Family Characteristics

Characteristic	CPS data collected January 1967 to present ¹	
	Persons	Families, households, primary and unrelated individuals
Total or White:		
United States or nonfarm.....	1.0	0.6
